145. During the treatment of constitutional syphilis it should always be kept in recollection, that whatever depresses the vital force, or impairs the general health, favours the development of the syphilitic contamination and its external or local manifestations: and that, if the remedies resorted to produce these effects upon the constitutional energies, they will very probably prove more injurious, than beneficial. Hence the remedies should be so combined, exhibited, and alternated; and so aided by a regulated diet, and by a

\* Dr. DZONDI, Professor at Halle, prescribes the bichloride as follows:—R. hydrarg. bichloridi gr. xij.; solve in aque distillatæ q. s. et adde mica panis, et sacchari albi, aa, q. s. ut fiant pilulæ cc., sing. gr. j. The pills are to be rolled in powdered Canella bark; and on the first day four pills are to be taken (¼ of a grain); on the second day none; on the third day six pills; on the fourth none; on the fifth eight pills; on the sixth none; on the seventh day ten pills, and so on, until the twenty-seventh day, when thirty pills are to be taken (1½ grain). The treatment is then complete; but in some instances of severe secondary symptoms they are to be carried even further. The pills may be taken on a full meal. Sarsaparilla is also to be taken during the course, or even afterwards. Also animal food is to be reduced to one

half the usual quantity; and pork and bacon avoided. The cold night and morning air, and cold and wet are to be shunned. I have been consulted by patients for whom this treatment has been adopted; but the cases have been too few to admit of an opinion respecting it. It is merely a modification of the well-known treatment advised by VAN SWIETEN.

healthy, temperate, or warm and dry atmosphere, as to promote the constitutional powers; improvement in the healthy appearance of the patient generally indicating the success of the medicine employed.

146. *B.* The local treatment of secondary syphilis consists chiefly of warm, vapour, or sulphur baths, for the eruptions; or of the application of lotions of corrosive sublimate, or ointments containing the unguentum hydrarg. nitratis, or the unguent. hydr. præcipitati albi, especially when the eruptions are severe, or are leprous or tubercular. If itching or irritation be experienced, lotions or frequent sponging the parts with a saturated solution of the borate of soda in any emollient fluid will generally be of much service. Dr. DRETT states that "for the common excoriated sore throat, any soothing detergent gargle will do. When there are ulcers, it is advisable to use gargles of corrosive sublimate; and when the ulcers are indolent they may be touched with the linimentum mercuris. Mercurial fumigation is also occasionally of benefit. It is effected by putting a scruple of red sulphuret, or of the common black oxide, or twice the quantity of mercury with chalk, on a heated iron, in a proper apparatus, and inhaling the vapour,—a heated penny piece in a tea-cup will answer the purpose.\* When a foul ulcer is

seated in the velum, or roof of the mouth, or pharynx, or alae nasi, an attempt may be made to check its ravages, by destroying its surface and edges with acid nitrate of mercury." (*Op. cit.* p. 190.). The ulcerations at the roots of the nail, or between the toes, are cured by the internal administration of mercury, and the application of a solution of nitrate of silver,—from four to ten grains to the ounce of distilled water. When the hair falls off the scalp, the hair should be kept short, and the dilute ointments, just mentioned applied, or the means resorted to which are advised in the article on the HAIR (§§ 32, *et seq.*).

147. Mr. H. COOTE remarks that the common warm bath effects but little in comparison with the Turkish bath, which is admirably suited for the chronic stages of secondary syphilitic eruptions\*, and which may now be procured in London. Extremes, or even alternations, of temperature should be avoided; and the regimen and diet should be regulated according to the habit of body, the usual modes of living, and the peculiarities of the case, avoiding too great abstinence on the one hand, and too full living on the other; moderation in all things being always observed.

148. vi. THE TREATMENT OF TERTIARY SYPHILIS.—In this state of constitutional contamination, mercury, if exhibited at all, should be prescribed with great caution, and it ought not to be given if it have been previously resorted to, either in prolonged courses, in large quantity, or in such a manner as to occasion copious salivation, or any of the more unpleasant effects, described in the article POISONS (§§ 562, *et seq.*). But if the patient have not had recourse to this mineral in any form, if none of the more severe tertiary affections exist, the bichloride of mercury may be prescribed in full and increasing doses in the compound decoction of sarsaparilla upon a full meal, or as advised by VAN SWIETEN, or mercurial fumigations may be resorted to. But if a manifest improvement in health, and in the local affection, in a reasonably sufficient time be not observed, or if there be any aggravation of symptoms from this treatment, the iodide of potassium should be substituted, and given in doses of three grains thrice daily, increasing them to five grains conjoined with the liquor potassæ, or with

\* Mr. HENRY LEE has given (*Transact. of Med. Chirurg. Society of London*, vol. xxxix., p. 339.) the following directions as to the use of mercurial fumigations:—

"Finding from experience that it was the light-coloured oxide alone which volatilized, and produced its effects upon the patient's constitution, and having reason to believe that the light colour depended upon the presence of calomel, I performed a series of experiments with calomel alone, or mixed in a certain proportion with the grey oxide. The general result of these experiments has been, to satisfy me that, for the purposes of mercurial fumigation, five or ten grains of calomel alone is, in ordinary cases, quite sufficient; and that when the grey oxide is used, the admixture of a few grains of calomel will facilitate its sublimation and insure its medicinal action."

"Upon making comparative trials with calomel alone and combined with steam, it was found to act more certainly and with greater irregularity in the latter case."

"The plan which I have adopted is very simple. Two small lamps are procured in which the methylated spirit (much cheaper than spirits of wine) is used; over the first lamp is a thin metallic plate, upon which the ten grains of calomel are placed; over the second lamp is a small cup of hot water. A small cane-bottomed chair is placed over the lamps, and the patient sits upon it. He is then enveloped, chair and all, in a blanket; at the expiration of a quarter of an hour or twenty minutes he rolls himself up in the blanket and goes to bed."

"For patients to whom it may not be convenient to procure the spirit lamps, the mode of proceeding may be varied as follows: The patient is directed to heat a thick tile in the fire; this is then put into a night stool, and a gallon full of warm water placed upon one corner of it. The calomel powder is then sprinkled over the rest of the tile, and the patient sits over it, being enveloped, as before, in a blanket. This mode of applying the vapour is very convenient in cases of affections, either primary or secondary, of the generative organs. It is not necessary in either case that the patient should breathe the mercurial fumes. It is remarkable how soon the patients' systems are brought under the influence of the mercury by this simple means; and, according to my experience, how effectually it acts in cases both of primary and secondary syphilis. Its great advantage, however, consists in the very little constitutional disturbance produced, and in the avoidance of those symptoms of irritation and debility, both mental and physical, which the prolonged internal use of mercury is so apt to occasion. The mercurial action, when the medicine is introduced through the skin, may be continued for nearly any length of time that may be necessary; and may be repeated as often as may be convenient, without injuring the patient's constitution."

"The small quantity of calomel which it is requisite to use at each fumigation, is probably one reason why mercury in this form may be used with such comparative impunity."

\* Mr. COOTE describes this bath as follows:—The clothes having been removed, and a suitable bathing dress supplied, the bather is conducted into a heated apartment, where he is allowed to sit and accustom himself to the increase of temperature. During this time the body becomes covered with a tolerably profuse perspiration. Next he is conducted to another apartment, where there is a higher degree of heat (115° F.), and the atmosphere is charged with watery vapour. There he reclines on a heated marble slab, and undergoes a slow process of shampooing. The quantity of cuticle that peels off surprises one who has not witnessed the process, but the skin is left in a cleaner state than perhaps it had been in for years. After the movements of the limbs have been tested in a variety of ways, the bather is conducted to a recess, in which is a fountain with hot and cold water, where he may apply soap and hot water as his taste dictates, or have the process performed by an attendant. A feeling of languor, not by any means unpleasant, supervenes, which renders a short period of repose on a couch agreeable. This process removes a large quantity of cuticle from the integument, causes the blood to circulate through the minute capillaries, and brings into activity the sudoriferous and sebaceous glands. We may, I presume, infer that without the proper performance of these functions, the skin is not in a healthy state; and that any morbid condition, such as lepra or lichen, would be materially benefited by rousing them into activity." (*Op. cit.* p. 108.)

either of the carbonates. In cases where mercurials have been freely employed, and especially where there is reason to infer that the affections of the periosteum or bones has been caused or aggravated by these medicines, or where there is doubt whether or no any of the tertiary affections have been caused as much by mercury as by the distemper, the decided use of the iodides of the fixed alkalis is generally the most beneficial. In cases manifesting more or less anæmia (See §§ 143, 144.), the courses of iodides, and still more those of mercury, should be followed by a course of the iodide of iron taken in syrup of sarsaparilla.

149. If the periosteum or bones be diseased, still greater caution in having recourse to mercury is required, although in strong constitutions, and where mercury has not been previously given, full doses of calomel and opium, or of these with camphor, will often initiate the treatment with benefit, and they may be continued or modified as long as they continue of service, and afterwards the iodide may be prescribed, increasing the doses until success result from it. I have generally prescribed this medicine in the following combinations.

No. 378. R Potassii Iodidi ℞. ad ʒij. i.—Liquoris Potassæ ʒij. (vel Potassæ Bi-carb. ʒij.) ;—Tinct. Aurantii (vel Cascarillæ) ʒv. i.—Extr-Fluidi Sarzæ ʒjss ;—Infusi Gentianæ Comp. ad ʒviij. M. Fiat Mist. cufus Capiat Coch. ij. vel ij. larga, ter in die in aque cyatho amplo.

150. It will generally be of service to take the iodide in weak solutions, even when it is prescribed in the largest doses. If it relax the bowels, a few drops of tinctura opii, or a little tinctura camph. comp. may be added to each dose ; or, the iodide and the alkalis may be taken in the compound decoction of sarsaparilla, to which a tonic or aromatic tincture, or an opiate, may be added, according to circumstances. When this remedy succeeds in removing the venereal affection, it should be continued for some weeks afterwards, gradually diminishing the dose. In some cases it causes irritation of the mucous surface of the throat, nostrils, and eyes, with a copious defluxion, or pains at the region of the stomach, or irregular febrile symptoms. These disorders are observed especially when the iodide has been given in too large doses, or uncombined with the carbonate or solution of potash. When taken thus uncombined, the acid in the stomach decomposes the iodide and the free iodine irritates the mucous surfaces.

151. In cases of ulceration of the pharynx, or larynx, or of disease of the bones, of the palate or nose, mercurial fumigations may be first tried, if mercury has not been already employed ; but care should be had not to allow it to affect the mouth. Sarsaparilla, with a cautious use of the iodide of potassium and sedatives ; the application of a strong solution of the nitrate of silver, or of the bichloride of mercury to the ulcerated surface, and of terebinthinate embrocations to the throat externally, are often beneficial. Gargles containing either the bichloride or the iodine, neither of these substances being in such quantity as to occasion much irritation of the throat, may also be tried. In all these the utmost attention and care are required. When tuberculated or other eruptions assume the characters of open sores or ulcers, the simple or compound tincture of iodine will be most advantageously applied to them, in modes and in degrees of dilution varying with their appearances.

152. When nodes are formed, the pain and consequences which often result, require iodine, alkalis, sarsaparilla, and opiates, with light nutritious diet, residence in a warm and dry air, and blisters over the affected parts. The blisters often should be repeated, in order to prevent, by the external discharge, the inflammation from extending to, or disorganising the osseous structure. If mercury have not been employed, the blistered surface may be dressed with strong mercurial ointment, and either with opium, or morphia ; and the diet and regimen duly regulated, with strict reference to the several peculiarities of the case, to the extent to which the general contamination and cachexia may have advanced, and to the state of the local affections.

153. vii SYPHILIS IN INFANTS AND CHILDREN.—The treatment should be directed not merely to the infant or child, when the state of either admits of any hope from treatment, but more especially to the parents. For these as well as for the child, a mercurial course, if not previously had recourse to, should be prescribed : and in the majority of cases, the bichloride of mercury, exhibited as above (§§ 141.) or combined with either of the tinctures of cinchona, will be found the most efficacious. Subsequently the iodide of potassium or iodide of iron and the preparations of sarsaparilla may be employed, according to the peculiarities of the case, more especially if anæmia be very manifest. It has been recommended for children to rub ten grains of mercurial ointment daily into the axilla or soles of the feet, or to administer half a grain or a grain of hydrargyrum cum creta every night until the symptoms disappear. But the disease is not so completely eradicated by these means as by a judicious exhibition and management of the bichloride, especially when followed by the means just named, varying the dose, and the vehicle in which it is prescribed, with the age and circumstances of the case.

154. X. SYPHILISATION, or the inoculation of syphilis, has recently attracted attention not only as a cure, but as a prevention of any future occurrence, of the distemper.—i. HISTORY.—M. AUZIAS TURENNE first proposed this startling mode of treating and of preventing syphilis in 1850, by bringing it before the French Academy of Medicine. This young physician commenced, about 1844, a series of experiments with the view of testing JOHN HUNTER'S doctrine of the non-communicability of syphilis to the lower animals. After many experiments and some failures, he succeeded in producing in monkeys, inoculated with chancre-matter, a true chancre, and the disease thus communicated to them was transferred to rabbits, cats, and horses. "The malady was again returned by inoculation from these to the human species, the first trials in this regard having been made by Dr. ROBERT WELTZ, of Wurzburg, on his own person. On four separate occasions Dr. WELTZ succeeded in producing an unmistakable chancre on his own person, by inoculation from animals, and this was acknowledged even by RICORD."

155. This discovery, as stated by Dr. RADCLIFFE, issued in one more surprising still, upon which the process of syphilisation is founded, namely, the strange and curative change of the disease when the inoculations are often repeated.

in the same individual. Experimenting upon apes, it was found that the artificial ulcers regularly diminished in size and virulency, in proportion as the inoculations were multiplied, until at length the virus ceased to take effect. The system seemed to become protected, as in ordinary inoculation and vaccination, and a state or diathesis was produced, in which the body was no longer capable of being affected by syphilis; and the process by which this is accomplished is that to which the name *syphilisation* belongs. This result, also, is all the more surprising because reiterated inoculations were evidently essential to it, for only once inoculated and then left to themselves, the poor apes speedily perished with all the signs of the syphilitic cachexy. Having satisfied himself of the reality of these results, M. AVZIAS TURENNE then proceeded to enquire whether man was capable of syphilisation. He had many ardent followers, who eagerly submitted to the experiment, and who shortly seemed to furnish evidence in the affirmative.\*

156. This pretension excited great opposition, particularly in the Académie de Médecine. In other quarters, however, the impression was more favourable. At Turin, M. CASIMIRO SPERINO, the chief surgeon in the Syphiliticoma, or Syphilitic Hospital of that city, at once took up the new views, and put them to the test on a large scale. He was favourably inclined towards them, he tells us, for several reasons. He had observed that severe inguinal buboes are more apt to follow small and insignificant chancres, which heal in a few days, than those which are large and obstinate; that the constitutional symptoms held an almost inverse relation to the severity and continuance of the local disease; and that he had known many prostitutes, whose constitutions had never been sensibly affected, who had had chancres for years, either constantly open, or closed only to open again immediately. He had repeatedly satisfied himself that foul buboes were more prone to heal in those cases in which their syphilitic character had been tested, after RICORD's plan, by inoculations on the surrounding skin.

157. The subjects of M. SPERINO's experiments were fifty-two hospital patients, all prostitutes, and all suffering from aggravated forms of primary or secondary syphilis. The virus was taken from the person syphilised, or from a comrade—from the first, if possible—and always from a growing ulcer. The inoculations were repeated once or twice a week in three or four distinct places, usually in the abdomen. The time required for the establishment of the artificial chancres was from two to three days. The effects of the second inoculations were less serious than the first, of the third, than the second, of the fourth than the third, and so on until the virus ceased to produce any effect whatever; contemporaneously with which epoch, all former ulcers had healed, and buboes, recent nodular enlargement of bones, and cutaneous stains or

blotches had either disappeared, or were in rapid process of disappearance. The virus, also, which made no impression at this time, was found to retain all its virulence when tried upon an unprotected person.

158. Since this time M. SPERINO has shortened the intervals between the several inoculations, and has increased the number of punctures in each operation to twelve, sixteen, or twenty, and with the effect (he tells us) of expediting the process, and of ensuring a slighter form of artificial chancre. He has also subjected his syphilised patients to a course of bathing in the sulphureous waters of Acqui, which waters are notorious for their power of bringing out secondary symptoms in the subjects of syphilis, and he has found them to resist this test as well as that of inoculation.

159. Such are the main particulars of these fifty-two cases, as gathered from M. SPERINO's communication to the Academy of Medicine and Surgery at Turin. No other treatment was employed. They are said to have been without exception of an aggravated character, and without any spontaneous tendency to heal. For a month before the institution of the experiments they had been purposely left without any treatment, and during this period they had retrograded.

160. An account of Dr. SPERINO's proceedings was given by Dr. RADCLIFFE (in RANKING's *Abstract of the Medical Sciences*, vol. xvi. p. 333.), and M. TURENNE's experiments were noticed by Dr. DE MERIC (*Lancet*, July, 1853, p. 203.) before Dr. SPERINO's work had appeared. The subject has been very recently brought before the profession in an able article on syphilisation in the "*British and Foreign Medico-Chirurgical Review*," (No. xxxvii. p. 410.), in which the subsequent experience of Dr. SPERINO in Turin, of Professor BOECK in Christiana, of Dr. DANIELSEN in Bergen, and of Dr. CARLSSON in Stockholm, during several years has been given. These enlightened men, professors and physicians to hospitals in cities where medical science is in its highest state of rational cultivation, instead of declaiming against the doctrine promulgated by M. A. TURENNE, have been engaged in a series of careful experiments and observations to determine its truth or its fallacy. Experiment and careful observation can alone decide this question, which is one of the greatest importance in practical medicine.

161. Dr. SPERINO's observations were confirmed by similar results obtained by Dr. GAMBERINI at Bologna, and by Dr. GULLIGO at Florence. In 1853, Dr. SPERINO published a detailed account of ninety-six cases of syphilisation. Of these ninety-six cases, fifty-three were of primary syphilis, and forty-three of the constitutional disease. Fifty of the cases of primary syphilis were cured, two failed, and one was not treated by syphilisation alone. "Of the forty-three cases of constitutional affection, twenty-six were treated by syphilisation alone, and seventeen by this method, in conjunction with mercury or iodine. Twenty-five of the twenty-six in the first category are said to have been cured. In only two cases of the primary disease did any constitutional symptoms appear, and these symptoms rapidly yielded under a continuance of the syphilisation. No relapse has yet taken place in any case. Many of these cases were of very severe character, and were such as were not likely to have healed spontaneously; while the numerous

\* In Dr. WINTERBOTTOM's work on the native Africans already referred to, it is stated, on the authority of Mr. EDWARDS the author of the "*History of the West Indies*," that the natives of the Gold Coast of Africa give their children the *gony* by inoculation; and that they perform the operation by making an incision in the thigh, and inserting some of the matter from the sores of the yaws. By this means the infants or children have the disease slightly and recovered speedily; whereas, by becoming infected at a later time of life, it is much more severe, and "gets into the bone." (Vol. II. p. 156.)

inoculations that were required, produced no serious effects, except in one or two instances a slight tendency to form phagedenic sores."

162. Dr. BOECK of Christiana, in 1853, published, in the seventh volume of the Norwegian Medical Journal, the results of a few experiments he had then made on syphilisation. Since then he has closely investigated the subject, and has extended the practice to infants at the breast. The same plan of treatment has also been pursued by Dr. DANIELSEN in the hospital at Bergen. When the writer of the review above referred to (§§ 160.) re-visited this hospital in July 1856, he was assured by this physician "that he fully coincided with the views of Dr. BOECK, and that the results obtained in Bergen by syphilisation were as successful as those recorded by the latter at Christiana." The reputation, talents, and high position of those physicians in Norway are unquestionable.

163. Dr. BOECK states that all the cases which he treated by syphilisation, laboured under constitutional syphilis, in its most varied stages and forms. Some of those cases had previously undergone every mode of treatment that science could devise, while others had had no treatment at all. He thought it of great importance to collect observations from both classes of cases. If syphilisation is not had recourse to till all other remedies have been tried, it is difficult to form a correct estimate of its powers; for under such circumstances, as Dr. BOECK justly remarks, we can hardly know what symptoms belong to syphilis, and what to the medicines administered; and particularly to mercury. He states, that cases which have undergone a mercurial treatment, persons of an inflammatory diathesis, habitual spirit drinkers, and weakly constitutions, should not be subjected to this treatment. In these cases the artificial chancres may take on a malignant action. "The bowels should be regulated, and the digestive organs brought into good order; but it is not necessary to enforce any strict rule of diet. In the hospitals of Bergen and Christiana, the ordinary full diet was always allowed." Dr. SPERINO and Dr. BOECK mention the readiness with which patients submitted to, and even sought for, the mode of cure which they had seen so successful with their fellow-sufferers.

164. ii. MODES OF INOCULATION. — M. A. TURENNE at first kept up a succession of single chancres; while SPERINO made three or four separate inoculations at once, and repeated these two or three times in the week. After having in this way reached twenty-four or thirty inoculations in all, he found that the chancres last produced were exceedingly small, and he then diminished the intervals, and made more inoculations at each sitting. He found that the first chancres were deeper, larger, and more inflamed than those which succeeded them: and that by diminishing the intervals and increasing the number of inoculations the earliest chancres visibly diminished, and were less painful and inflamed. After a large number of inoculations which did not appear successful, he returned to his former plan of inoculating for six to ten chancres at a sitting. "While these chancres are progressing, it is not advisable to inoculate afresh, nor should this be done until the former chancres are developed. Should the chancres be developed too freely and threaten active inflammation, or to extend as phagedenic

sores, he checks their progress by inoculating afresh at shorter intervals."

165. The practice of Dr. BOECK differs little from that of SPERINO. He inoculates for two chancres only every six days, because he found from experience that it required about five days to produce induration in a chancre, although he does not consider this latter circumstance absolutely essential. He subsequently shortened his intervals to three days, and increased the inoculations to eight or ten. Less time is thus required to produce immunity; but Dr. BOECK is distrustful of pushing cases too rapidly through their course of syphilisation. With regard to the parts of the body selected by these physicians for inoculation, SPERINO preferred the lower regions of the abdomen, Dr. BOECK the arms and thighs.

166. The conclusions drawn by Dr. BOECK from the eighty-four cases of syphilisation, which he has treated up to March, 1856, are,—1st, That in all cases, without exception, immunity to the venereal virus is obtained sooner or later by inoculation of this poison; 2d, That the symptoms of syphilis present at the commencement of syphilisation disappear during the employment of this mode of treatment; 3d, That the general health does not suffer in the least from syphilisation—on the contrary, if the patient has been in weak health before inoculation, he most materially improves in strength and appearance during the process. These propositions are conceded as undoubted facts by Dr. BOECK's colleagues, by Dr. SPERINO, by M. A. TURENNE, by DANIELSEN, by Dr. CARLSSON, and by Dr. STENBERG of Stockholm.

167. *The time required to produce immunity from syphilis by syphilisation depends upon the various strength of the virus, upon the rapidity or otherwise with which the inoculations succeed each other, upon the number of the chancres produced, and upon the idiosyncrasy of the patient.* Dr. BOECK states that, "the attaining to immunity depends upon the length of the intervals between each inoculation—the more frequent the inoculation the more rapidly does it ensue. If there were sufficient virus to be obtained, we might, if we chose, inoculate every day; but if, as is generally the rule, we keep to obtaining the virus from the most recent inoculation, we cannot easily do this. From my own experience, I would say that the matter obtained in a pustule of only one day's growth is generally capable of being inoculated; but I have also seen that pustules of three days' growth produced no effect; while three days later, the matter taken from them was decidedly contagious." (p. 196.)

168. Granting that immunity is really produced from the disease, the question follows, Is it merely from the existing disease, or from any subsequent infection? and if from subsequent infection, is the immunity produced for a time only, becoming impaired gradually, and ultimately lost after an indefinite time; or is it continued through life, a diathesis being imparted by it, rendering the frame insusceptible of the syphilitic infection? That the immunity is at least, for a time, is shown by the fact of the last inoculation having failed to take effect, however virulent the matter employed. Dr. BOECK is of opinion that persons who have reached perfect immunity to inoculation in the course of syphilisation are insured against contracting syphilis for all the rest of their

lives; but the lapse of time since the first employment of this practice admits not of any conclusive evidence of the fact.

169. Of forty-two cases of constitutional syphilis, where no mercury had been previously used, not one had exhibited any relapse up to the commencement of 1856, and many of these had been for three years or more without requiring any treatment whatsoever. Of the twenty-one cases recorded in Dr. Boeck's first work, six had been treated without mercury, and in all these syphilisation dispersed the symptoms, which have never returned. The average duration of the treatment in these six cases was six months and two days, the average number of chancres were 322. In a second class of cases, in which the constitutional symptoms were chiefly confined to the skin and mucous membranes, but which had all taken more or less mercury, the average duration of treatment was six months and twenty-four days, the average number of chancres being 432; two thirds of the number being, however, very small and transient. In the third category of cases, in which the constitutional disease was very inveterate, all of which had been subjected to mercurial treatment, some repeatedly, the average duration of treatment was seven months and twenty-four days, the average of chancres 570.

170. The increase in both of the last categories of cases in the number of chancres, and in the length of time required to complete the cure, is ascribed by Dr. Boeck to the previous administration of mercury. It is, however, probable, as he observes, that another circumstance may have retarded the cure, viz., that the syphilitic virus may have undergone a material change during the many years it had been resident in the system. The more inveterate, and especially the tuberculo-serpiginous forms were found to be extremely rebellious to treatment, and some of them were not cured when immunity was reached. It was necessary then to have recourse to iodine, upon the exhibition of which all symptoms rapidly disappeared, though previous to syphilisation both mercury and iodine had proved inefficacious.

171. Dr. Boeck suspects that in those very obstinate cases an union of the syphilitic with mercurial poison has taken place. In most instances this union seems to be dissolved by syphilisation, and then iodine, which had before been ineffectual against the united poisons, acts readily on the mercury, and eradicates it from the system. During the two years elapsed from the publication of his first work, he had treated sixty-three cases by syphilisation, and of these thirty-six had never taken mercury. In the twenty-seven cases, for which mercury had been given, he invariably found the cure more difficult, and in some cases impossible without the aid of iodine. Where mercury has not been employed, he is decidedly in favour of syphilisation, for, as far as can be ascertained from the forty-two cases of this character thus treated, no relapse had occurred up to the present period. A great objection to syphilisation is the length of time required for its complete performance. In the Christiana hospital, the average duration of the mercurial cure is three months and a half, while syphilisation averages a full half year. If, however, the latter be not liable to relapse—at least in non-mercurialised cases—it is preferable even if it required a much longer period. It is doubt-

ful whether it be possible to syphilise, so as to cure permanently, by matter taken from one source alone; for Dr. Boeck met with cases where complete immunity existed to the matter taken from one source; but upon obtaining fresh virus from other persons, the inoculations succeeded perfectly again. However, he has been able, in some instances, to effect a complete and permanent cure with matter from one source alone.

172. I have given this account of syphilisation, as it is hardly known in this country. It is manifest that it could not be rationally submitted to, but as a cure of the distemper, and not by a healthy person to prevent the infection of it. If, however, it be found to be by further experience, not only a permanent cure, but also a permanent preventive, it will establish for itself a reputation not possessed by any other means; for none besides, however judiciously administered, has been found constantly and permanently curative,—has proved a remedy under all circumstances, and for the future duration of life in all cases.

**VERTIGO.** SYN.—*Vertigo* (from *verto*, I turn round); *περιστροφή, σούσιμα*. *Vertige*, Fr.; *der Schwindel*, Germ. *Giddiness*, *dizziness*, *swimming in the head*.

CLASSIF.—IV. CLASS. III. ORDER (*Author*).

1. DEFIN.—*A transitory erroneous perception, or a sense of general whirling or turning round, with difficulty of standing, or a feeling of impending sinking or falling.*

2. *Vertigo* has been noticed by HIPPOCRATES, GALEN, ARETÆUS, and other ancient writers; and, by these, as well as by modern writers, it has been viewed chiefly as a symptom of many diseases, and in some, but in much rarer cases, as the chief or only apparent disorder. That it is as much a primary affection, on some occasions, as headach, or several other disorders, may be admitted, although it may be shown, if the pathogeny of the affection be duly considered, that it is commonly owing to previous disorder of the organic nervous influence endowing the brain, or to the state of the capillary circulation in this organ, or not improbably to both in various degrees. In the great majority of cases, however, it is merely a symptom, either of a very early, or of a more or less advanced stage of some malady, very often of some disease which has not fully declared itself, or which still remains latent or imperfectly developed, or of extreme debility, or of protracted indigestion, &c.

3. I. DESCRIPTION.—*Vertigo* occurs as an illusion, or a transitory erroneous perception of objects, although quiescent, in a state of more or less rapid motion, usually in that of gyration or whirling round; but also not infrequently with either a descending or ascending movement, or with a sense of sinking. In the more extreme cases, or when caused by ebriety, these sensations are often present in a greater or less degree, although the eyes at the time are quite shut. In some instances the objects which thus appear in motion are also changed in colour—are either variegated or obscured. *Vertigo* may be experienced only when assuming the erect posture, as in cases of fever, extreme debility, &c.; but it may also be felt whilst recumbent in bed, objects presenting not only a rotatory, but also an ascending motion, with a feeling of sinking, and sometimes also with noises in the ears. In this latter form it should be viewed as a most serious symptom, especially when occurring in malignant or pestilential maladies, or when these are prevalent, or in the course of organic disease of the brain. In many instances, *vertigo* precedes, or is followed by, severe paroxysms of retchings or of vomitings. This sequence is commonly observed in pestilential cholera, in sea-sickness, in fits of drunkenness, after ingestion of the sedative or depressing and irritating poisons, and especially after the improper or inordinate use of tobacco. In all cases of *vertigo*, walking or even standing is difficult or impossible; and from a dread of falling, objects

are laid hold of for support. *Vertigo* may be only temporary and quickly evanescent, or it may continue for a considerable time. It is more rarely continued or prolonged. It is often evanescent, but marked, when it occurs as a prelude of syncope, or of fully developed disease of the brain, as epilepsy, paralysis, or apoplexy. It often precedes amentia and other states of insanity. SWIFT was very subject to *vertigo* at different periods of his life, and more especially before the loss of his powerful mental faculties. It is more prolonged or continued when it is a symptom of either active or passive congestion of the cerebral vessels, or of anæmia of the brain, or of the vascular system generally. When *vertigo* occurs as a severe or acute paroxysm, it may gradually pass into the epileptic state; the extreme giddiness, after several occurrences of the seizure, being attended by a temporary loss of consciousness, and ultimately by convulsions and all the phenomena of a complete epileptic attack.

4. The more continued or prolonged states of *vertigo* are generally referable to the following pathological conditions:—1st, To determination of blood to the brain; 2d, to congestion of blood in the cerebral vessels, owing to impeded return of blood or retarded circulation through the heart; 3d, to lesions of the cerebral arteries, and softening of the structure of the brain; 4th, to general or local, momentary or prolonged, anæmia, or insufficient supply or circulation of blood in the brain. In these states, however, one or other of the primary changes already assigned as characterising the more evanescent states of the affection (§§ 3.) are also present. In either of these forms, or owing to either of their pathological states, *vertigo* may manifest certain grades, either of which only may be complained of, or all of which may supervene in succession, either very slowly and imperceptibly, or more or less rapidly. These states or grades are usually described as—1st, confusion, unsteadiness, or indistinctness of perception;—2d, dizziness or fear of falling;—3d, giddiness, with incapacity of progression;—and 4th, swimming in the head, or complete *vertigo*, with an incapacity of standing.

5. i. *The occasional exciting causes* of *vertigo* are very different, or even opposite in different cases. Whatever determines the blood inordinately to the brain, as, long and intense thought and reflection,—or prevents or impedes the return of blood from this quarter, as, cinctures, of the neck, &c.; and whatever promotes a rapid return of blood from the brain, as, suddenly assuming the erect from the recumbent posture, long abstinence, inanition, and, in short, whatever occasions too great fullness, on the one hand, or too great a deficiency of blood in the brain on the other, will, in weak, susceptible, or predisposed persons, give rise to this state of morbid perception.

6. *Vertigo* is most frequent in persons of advanced age, in hysterical females, in persons who are bald, especially on exposure to cold, or in cold seasons and in variable weather; in those liable to hæmorrhoids, epistaxis, or other hæmorrhages, especially when these are suppressed, and in crowded and close apartments; in females during prolonged lactation; in persons addicted to excessive sexual intercourse, or to the vice of

masturbation; and in those who indulge in too much sleep or who lie too long in bed, or who live irregularly as to diet and regimen.

7. The more common causes of vertigo are obviously those which produce the diseases of which vertigo is a more or less prominent symptom; whilst those occurrences of it which assume more of a primary or idiopathic form, are referable entirely to whatever occasions the pathological states of which it is a chief manifestation. Thus, if it be imputed to vascular determination to, or congestion of blood in, the brain, the numerous remote and efficient causes of these conditions should be ascertained, as indicating the only obvious means of removing the affection. If it be chronic, protracted, or of frequent recurrence, the temperature of the scalp, the state of the arterial and venous circulation in the neck, temples, &c., the circulation through the heart; the functions of the stomach, bowels, and kidneys, &c., severally require examination, especially with reference to excessive or to deficient fulness of blood in the vessels of the brain. The causes of these very opposite conditions are generally manifest, on due investigation; but these conditions are commonly attended by others of not less importance, namely, by excited, or by depressed vital power—by the latter especially. This association of disordered circulation with depressed vital power obtains in most cases of this affection, whether protracted or evanescent; and, in febrile diseases, the blood is also more or less altered, although not in a manifest degree at an early stage of these diseases. The impairment or depression of vital power is especially evinced by the organic nervous system, through the media of the several organs which this system endows, and more particularly of the digestive, assimilating, and generative organs. Impairment of the former, and exhaustion from abuse of the latter, are among the most efficient sources of this affection, in its more chronic forms. When it proceeds from this last source, the disorder is often most protracted, and most difficult to cure, for the cause generally continues; and it not infrequently assumes a recurrent or periodic form, and even ultimately, but gradually, passes into fully developed epilepsy, or the worst forms of hysteria. Of these results I have seen several instances in both sexes, in the course of my practice.

8. ii. The chief states and associations of Vertigo may be enumerated as follows, with reference to their causes:—1st, *Vertigo nervosa*: nervous, hysterical, epileptical, or hypochondriacal vertigo. 2d, *Vertigo traumatica*, from injury, concussion, &c., of the brain. 3d, *Vertigo plethorica*, from determination of blood to, or inflammation or active congestion of, the brain. 4th, *Vertigo toxicata*, from poisons, especially sedative and narcotic poisons, and from poisonous fish, meats, &c. (See Art. POISONS.) 5th, *Vertigo febrilis*, in the invasion and progress of most fevers, especially when the organic nervous force is depressed, and the blood contaminated. 6th, *Vertigo gastrica vel Stomachica*, from gastro-bilious disorder; such disorder, however, often being, as well as the vertigo, merely symptomatic of disease of the brain. 7th, *Vertigo exsanguinea*, from an insufficient supply of blood to the brain, or from general anæmia, or unequal distribution of blood. 8th, *Vertigo cardiaca*, from disease of the heart impeding the

return of blood from the brain. 9th, *Vertigo arthritica*, from misplaced or retro-cedent gout. 10th, *Vertigo rheumatica*, from rheumatism of the membranes of the brain, or of the pericranium. 11th, *Vertigo accidentalis vel fugax*, from various odours or smells, especially in certain idiosyncrasies, or from various causes, often of an indefinite or not very manifest nature.

9. iii. *The diagnosis and morbid relations of Vertigo.*—The nature of the affection is generally manifest from the account given by the patient of his sensations. It may, however, in the more sudden attacks, be mistaken for a slight seizure of either apoplexy or epilepsy. From both these it may be readily distinguished by the loss of consciousness, which does not occur in vertigo. When fits of vertigo are likely to pass into epilepsy, a momentary loss of recollection or consciousness then generally characterises them. The difficulty in the diagnosis respects chiefly the pathological condition of which vertigo is a chief or related manifestation—as regards the states of organic nervous or vital power, and of vascular action or congestion in the brain—as to the affection being a precursor of a febrile or exanthematous disease, or a symptom of disordered digestive function, or of misplaced gout, or of most serious disease, or of structural lesion of the nervous masses within the cranium. This, the most important diagnosis of vertigo, entirely depends upon the peculiarities of individual cases; upon the age and previous diseases of the patient; upon the recognised and presumed causes of the affection; upon the states of organic, nervous, or constitutional power, and of local and general vascular action, and upon the phenomena observed, and the symptoms ascertained, during the disorder. It must be apparent from this, that the knowledge, acumen, and experience of the physician, will be called into requisition in most cases of vertigo; and his success in their treatment will altogether depend upon the pathological inferences he may form.

10. There are other circumstances than the above to which attention should be directed; and amongst these the probable existing morbid states causing this affection at different periods of life may be noticed. If the disorder occurs soon after, or even several years after, puberty—and if the patient be thin, pallid, or anæmied, and be incapable of directing his eyes firmly on the person addressing him, impaired nervous power, very probably occasioned by masturbation, may be inferred. If the affection occur in mature or advanced age, although it may proceed from disorder of the digestive organs, it may, as well as such disorder, be much more likely a prominent symptom of disordered circulation in the brain, caused either by atheromatous, fatty, ossific, or other changes in the coats of the arteries, or by disease of the heart, of its valves, or even by organic lesion of the intimate structure, or by more manifest alterations of the brain, either consequent upon one or other of these morbid conditions of the vessels, or taking place independently of them. I have seen cases where this affection has been produced by these several lesions, by scrofulous, tubercular, cancerous, or other formations in the membranes or substance of the brain, and by impeded return of blood from the head. In a remarkable case of colloid cancer of the mamma, under

my care a few years ago, that was seen by Dr. RAMSDOTHAM and Mr. FEROUSSON, the cancerous disease ultimately invaded the brain, occasioning, for a considerable period, constant vertigo, and ultimately general paralysis and coma. The connection also of vertigo with the gouty diathesis, and the occurrence of it as a form of misplaced gout, should not be overlooked when it affects persons of mature or advanced age, especially when the exact nature of the affection is clinically investigated. The connection of this affection also with cachectic states of the system, with imperfect excretion and depuration of the blood, and with disordered function or organic lesions of the kidneys, but still more intimately with organic lesions of the heart, its orifices, or of its valves, demands due consideration. Several instances of chronic vertigo have come before me which had been referred to cerebral disease, but which, upon auscultation of the heart, were found to depend upon impeded return of blood from the head, owing to interrupted circulation through the heart.

11. II. THE PROGNOSIS of vertigo should be always given with caution, and often with much reservation. In some cases, especially in early or middle age, when the affection is slight, and depends chiefly on disorder of the digestive organs, or the organic nervous system, a favourable opinion may generally be given, unless there be reasons to infer that it is a precursor of fever of an exanthematous or any other form; and then the result will entirely depend upon the consecutive disease. Whenever the affection occurs suddenly or in fits, then its passage into fully developed epilepsy should be dreaded, however judicious the treatment may be, more especially if there be any reason to infer that it is caused by masturbation, or by excessive venereal indulgences. Of this causation and transition of vertigo, many cases have come under my observation, not only in early and middle, but also in far advanced age. In this last period of life, as well as in middle and mature age, vertigo, in any of its grades, should always be dreaded and viewed as a precursor of a more serious or dangerous attack. In these cases the symptoms connected with the organs contained within the cranium should be carefully observed, especially the several senses; the temperature of the scalp, the state of the pulse in the carotids; the action, rhythm, and sounds of the heart, and the appearance of the veins of the head and neck, and an opinion be given conformably with the evidence furnished by these sources, the *juvantia* and *lædèntia* being also taken into due consideration.

12. III. THE TREATMENT should be based upon the inferences arrived at as to the causes and pathological states of vertigo. — (a.) If the causes inferred be such as reduce organic, nervous, or constitutional power, and if they are of such a nature as are likely to convert the disorder into either hysterical or epileptic seizures, as certain of the causes above noticed (§§ 6, *et seq.*), a restorative, antispasmodic, or tonic treatment, such as the preparation of valerian, assafoetida, zinc, &c., cod-liver oil, oxyde of silver, &c., ought to be prescribed; and if there be any indications at the same time of local or general anæmia, chalybeates, either alone or in addition to these means, are also required. In cases of this description, as well as in those indicating a tendency to as-

sume either a hysterical or epileptic character, I have found the tincture of sumbul, either alone or conjoined with other medicines of a tonic or antispasmodic nature, of great service in several cases. In these also I have prescribed the cotyledon umbilicus, but not with so marked benefit as I expected, although it also was sometimes very beneficial.

13. (b.) In persons who are liable to vertigo from prolonged or profound thought and reflection (§ 5.), and especially if the scalp be hot and vascular determination to the brain, as evinced by the action of the carotids, be excessive, cooling applications to the brain, local depletions, internal and external derivations, purgatives, a regulated diet, and, above all, the avoidance of the cause, change of air, of scene, and of habits, travelling, voyaging, &c., and relaxing amusements, or agreeable and slight occupations merely, are the means upon which the chief reliance should be placed.

14. (c.) In persons of a full habit of body, in those who live luxuriously, or even moderately, and who take little exercise, the temperature of the scalp, the pulsation of the carotids, or the action or sound of the heart, indicating local or general plethora, or impeded return of blood from the head, the occurrence of vertigo should be viewed in a very serious manner, and local depletions, derivations, both external and internal, purgatives, setons, or issues, spare diet, and regular exercise in the open air are generally beneficial. Other means in addition to these may be resorted to; but they must be left to the judgment of the physician, who will prescribe them appropriately to the features characterising individual cases. Emetics, the application of cold to the head, the restoration of suppressed hæmorrhages, bleeding from the nostrils, and venæsection, were the chief means recommended by ARÆTUS for vertigo, and they are indicated in the circumstances just now mentioned; but emetics should follow, not precede, the other means when cerebral or general vascular plethora is present.

15. (d.) In cachectic habits of body, in cases manifestly depending upon disorder of the digestive organs, and when the temperature of the scalp, and the local and general states of the circulation and of vascular action, present no contra-indication of the propriety of the practice, the treatment of vertigo may be initiated by the exhibition of an emetic. When this affection is indicative of the commencement of fever, or of one of the exanthemata, and is attended by lassitude, pains in the back or limbs, or by chills or shivering, this practice is then also productive of benefit; but ipecacuanha or sulphate of zinc should be preferred to antimony, as an emetic; or, if this last be prescribed, it will be advantageously conjoined with a warm, aromatic, or antispasmodic medicine, such as Cayenne, ginger, &c.; but it ought not to be repeated oftener than once. Vertigo in the gouty diathesis requires, in the first instance, cholagogue purgatives followed by alkalies, magnesia, sulphur, and other vascular depurants, which increase the functions of the kidneys, skin, and digestive mucous surface. In all cases of vertigo unconnected with the invasion of either of the forms of fever, the previous habits, modes of living, and disorders of the qu-

tient should be ascertained, and a more or less complete change of these habits be insisted upon, as far as his age and other circumstances may render the change advisable.

#### VOICE AND SPEECH—DISORDERS OF.—

I. Voice and speech are functions by means of which the human species claims and maintains an ascendancy over all animated nature. The more perfect animals, including the winged creation, possess the power of emitting vocal sounds, which admit of such changes in power, modulation, and character, as convey intimations to individuals of their own genus or species of danger, of pleasure, of sources of nourishment, of desire, and even of affection. The practised ear can recognise, in nearly all animals which emit sounds, variations in cadence, character, and power, which are known by the same species as announcements of the presence of objects of prey and subsistence, of sources of danger, of the loss of offspring or objects of affection, and of danger, suffering, or distress. And it is by no means improbable, that the sounds characteristic of individual species, even of the lowest capable of emitting them, are

so modulated as to convey to one another the various instincts and suggestions, which seasons, localities, and external circumstances and influences, may excite; the sounds thus modulated becoming known, as regards each species, as a distinct, but limited language, although unknown, unless in its more manifest and prominent characters, to man.

2. The sounds produced by the organs, so wonderfully and beautifully provided for them, in the human species, are the chief means of developing the mental faculties, of exercising dominion over the rest of the animal creation, and of acquiring and of exerting power over those requiring guidance or governance. The sounds produced by the human organs of vocalisation and articulation are the manifestations furnished to the species of the finest sentiments, of the deepest as well as the highest states of feeling, of the most profound and abstract results of thought, and the wisest and best revelations of mental reflection and of human reason. But considered philosophically, they are studies rather for the physiologist than for the pathologist. To the latter, however, the more strictly philosophical consideration of human sounds, as manifested in the modulated voice and in speech, becomes a necessary introduction to an intimate knowledge of the several modes in which both voice and speech are disordered, or more or less impeded, or even lost. For these preliminary sources of knowledge the reader is referred to the recent writings of MÜLLER, CARPENTER, TODD and BOWMAN, BISHOP and WILLIS, which are in the hands of most medical men.

3. Vocal sounds and articulate speech or language are two distinct functions; and although the latter proceeds from the former, an additional apparatus is required for its production. The instrument of vocal sound, the larynx, is distinct and appropriate to this purpose, and is calculated by its mechanism to produce the several grades and modulations of voice; but, although thus independent, the vocal sounds cannot be modified into articulate speech, or even into a near approach to articulation, without the aid of the oral cavity, more especially of the tongue. Hence there may be vocal sound without speech; but this latter cannot be produced without the former; and hence both may be separately or even conjointly disordered, or even lost. But, although speech may be altogether lost, a vocal sound can hardly be quite lost whilst respiration is performed, unless in complete syncope, catalepsy, apoplexy, in the coma of fever, and in other occasions of loss of sensibility and consciousness; for even in these states, unless in profound syncope and catalepsy, a simple or low respiratory sound may still be emitted.

4. I. Voice is produced, according to Mr. BISHOP, by the conformation of the vocal apparatus, which combines the properties of a stretched chord, a membranous pipe with a column of air vibrating in it, and a reed, and is the perfect type, of which these instruments are only imperfect adaptations. Dr. CARPENTER states, "that the sound is the result of the vibrations of the vocal ligaments, which take place according to the same laws with those of metallic or other elastic tongues; and that the pitch of the notes is chiefly governed by the tension of these luminæ." However, the

various tones, modulations, &c. of the voice may be explained, or referred severally to the especial or combined movements and actions of the different parts constituting the vocal apparatus by physiological writers, it must be manifest that a healthy condition of the vocal chords and ligaments, of the cartilages, of the muscles which move them, and of all the parts both above and below the larynx, as well as of the larynx itself, and the mucous membrane covering it and its vicinity, and even of the velum palati also, is necessary to the production of the human voice in its natural and perfect state; and consequently that this function, capable of the utmost perfection, of the greatest range in power and modulation, and of astonishing improvement as regards these, by careful and scientific cultivation, depends upon a perfect condition of these several parts, disorder or structural lesion of any one of them affecting the voice in a more or less remarkable manner.

I. APHONIA.—LOSS OF VOICE.—SYN. — *ἄφωια* (from *α* priv. and *φωνή*, voice).—*Aphonia*, Vogel, Sagar, Cullen. — *Dysphonia*, Good. — *Raucedo paralytica*, Darwin. — *Perte de la Voix*, Fr.—*Die Stimmlosigkeit*, *Aphonie*, Germ.

CLASSIF. IV. CLASS. II. ORDER. (See Preface.)

5. DEFINIT.—*More or less impairment or complete loss of the power of emitting vocal sound, owing either to functional disorder or to structural lesion.*

6. The voice may be impaired in every degree from the slightest catarrhal form to the most complete loss from organic change. The impairment or loss may be either temporary or permanent. The slightest as well as the less permanent aphonia often proceeds from functional disorder, especially from extreme nervousness, fright, fear, and hysteria; but it also is frequently caused by catarrhal congestion of the mucous membrane of the larynx and of the subjacent cellular tissue, and by temporary impediment to the movements of the vocal chords from this cause, or from inflammation and its results implicating for a time any of the parts of the vocal apparatus. In the more strictly nervous states of aphonia there is no manifest lesion of structure, the nerves supplying the laryngeal muscles and chords having become for a time incapable of conveying the dictates of volition to these parts, unless volition be most energetically exerted.

7. A. FUNCTIONAL APHONIA occurs chiefly in delicate, nervous, or hysterical females, and much more rarely in similarly constituted males. In the former sex it is most frequent about and subsequently to the period of puberty, and during the catamenial epoch of life; in the latter chiefly before the period of puberty, and only in very rare cases, and when occasioned by fear or fright, and it is then of short duration only.

8. *Hysterical Aphonia* may be viewed as one of the forms of functional paralysis, which not infrequently complicates disorder of the female organs, such disorder being generally either not otherwise manifested, or latent, or masked by some other affection. In most cases it is easy to distinguish the hysterical from all other forms of aphonia; other allied symptoms, the previous history of the case, the state of the uterine functions, the moral affections, impressions, and sentiments, which may have preceded the loss, &c., generally indicating its nature. It should not be overlooked that, in hysterical females, more espe-

cially in those most subject to uterine or sexual irritation, aphonia is sometimes *feigned*. In rare instances, also, it may be difficult to determine whether or no it is hysterical or owing to structural disease in or near to the base of the brain; and this difficulty is increased, 1st, by the absence of other hysterical symptoms, and, 2dly, by the presence of other states of cerebral paralysis, the catamenial functions or organs having been previously disordered. I was recently called in consultation to a delicate nervous female, aged 18, who had menstruated irregularly and scantily, and was seized with incomplete hemiplegia and complete loss of voice; the muscles of the face not being affected. In this case it was difficult at first to determine whether the aphonia was hysterical or owing to some lesion within the cranium, causing also the hemiplegic affection. Their history and progress, however, generally elucidate the nature of these cases.

9. B. STRUCTURAL APHONIA is caused, *firstly*, by changes implicating one or more of the parts composing, or in the immediate vicinity of, the vocal apparatus; and, *secondly*, by lesions at the origin or in the course of the nerves distributed to the laryngeal muscles and vocal chords. The slighter or more incomplete forms of aphonia are those of a catarrhal nature, arising from more or less congestion and tumefaction of the mucous and submucous tissues of the larynx and adjoining parts. Severe cases of aphonia are often occasioned by serous infiltration into the submucous tissue, with or without inflammation of the mucous membrane of the larynx and of its vicinity, in the direction either of the fauces or of the trachea, or of both. This serous infiltration may be slight, and continue only during the catarrhal attack, or it may be so very considerable as to nearly suppress the voice altogether and cause suffocation, as observed in *œdema* of the glottis and epiglottis. Aphonia from this and other affections of the vocal apparatus is fully considered in the articles LARYNX and TRACHEA, where the lesions which affect the voice are described, and the treatment appropriate to each pointed out. The voice may also be affected in different degrees by inflammatory affections of the fauces, pharynx, and tonsils, by tumours in these situations, or by morbid growths pressing upon or implicating the larynx or trachea, by aneurisms, and most frequently by chronic laryngitis and its consequences, especially thickening, ulceration, &c., arising either primarily or consecutively of acute laryngitis, or of tubercular disease of the lungs, or of syphilitic infection. All these are fully discussed in the articles now referred to; but in all the voice is affected rather than the power of articulation, which is perfect as far as the production of vocal sound admits; for the affections of the larynx in such cases are rarely associated with any interruption to the movements of the tongue and of the parietes of the oral cavity, by means of which articulation or speech is performed.

10. II. DEFECTUS LOQUELÆ, SYN.; — *Alalia*, Frank.; — *Loquela Abolita*, Auct. Var.; — *Mutitas*, Sauvages, Macbride, &c.; — *Sprachlosigkeit*, *Stummheit*, Germ.; — *Loss of Speech*.

11. *Voice*, as stated above, is produced by the larynx, its modulations into musical sounds being

effected by means of this organ aided by the epiglottis and adjoining parts. *Speech* is the modification of the voice, or sounds emitted by the larynx, by the organs or parts intervening between it and the os externum. It is obvious that, to produce articulate sounds, forming language, the movements of the tongue, fauces, and connected parts must be complete; and that these should be in a healthy condition to render articulation perfect. The tones of the voice, and articulate speech, cannot be produced in childhood, when the sense of hearing is completely lost in early infancy, or in the foetal state; and as long as the sense of hearing continues lost, *dumbness* is the result; for the sense required to modify and adjust vocal sounds does not exist.\* *Voice*, especially in its healthy and cultivated states, and in its modulations into music, is capable of expressing the several emotions of mind, in a more remarkable degree and manner than articulate speech; but *speech* or language has a much greater, more varied, and more extensive power of addressing, informing, and enriching the intellect, of furnishing definite ideas of objects, properties, actions, &c., and of conveying the results of reflection and of rational deductions. The vocal organ, aided by the movements of the tongue and parts composing the oral cavity, is adapted for, and in health is capable of, forming a number of simple sounds, which are readily combined into groups forming words. Dr. CARPENTER justly remarks, that the number of combinations which can be thus produced is so inexhaustible that every language has its own peculiar series; no difficulty being found in forming new ones to express new ideas. There is much diversity in different languages, even with regard to the use of the simplest of these combinations; some of them are more easy of formation than others, and these accordingly enter into the composition of all languages; whilst, of the more difficult ones, some are employed in one language, some in another; no one language possessing them all, or using them to any co-ordinate extent.

12. The mechanism producing vocal sounds being complicated, and actuated in its individual parts and in its combined movements by volition, and by the states of vital force, as influenced by health, constitution, and disease, and adjusted by the sense of hearing, it necessarily follows that the faculty of speech, in whatever language, will be modified, altered, interrupted, impeded, and even altogether lost, in numerous

\* The nicest modifications and adjustments of the actions of the muscles of the larynx, and of the several parts of the fauces and oral cavity, are requisite to the production of determinate tones, accents, and speech; and these actions are ordinarily adjusted and modified by the sense of hearing. Hence a fine or educated ear in music is of great advantage in singing and in the pronunciation of languages. This adjustment, being learned in the first instance under the guidance of the sounds actually produced and heard, is subsequently effected voluntarily, in accordance with the mental conception—or inward sensation—of the tone or sound uttered, which conception cannot be formed unless the sense of hearing has previously brought similar tones to the mind. Hence it is that persons who are born, or become, quite deaf before articulate speech is formed or attempted, are also dumb. They have no malformation, no paralysis of any part of the organs of voice and speech; but they cannot utter distinct musical tones or articulate speech, because they have not the guiding conception or sensation of the nature and character of these sounds, furnished by the sense of hearing.

modes, so as not only to furnish most important indications of disease of the slightest as well as of the most dangerous nature. The articulate sounds which have become familiar to the ear, are often remembered as long as the appearance of the person by whom they were furnished; and the person, even after many years, is often recognised by his voice and speech before he is seen. Debility weakens the articulating power, or the strength of articulate sound; but disease may alter it more remarkably, different maladies affecting it in various ways. When the voice is altered, or lost by disease, the speech is then necessarily similarly circumstanced, as already stated (§§ 5. et seq.) But speech is more especially affected as a precursor, or as a symptom, of apoplexy and paralysis; and, when so affected, it indicates the most serious results at a period, which, although indefinite, may generally be viewed as comparatively short. In cases where speech is altogether lost, especially at an advanced age, or is so nearly lost as hardly to be understood, or when the sounds are mostly inarticulate, if no apoplectic or paralytic seizure have preceded or accompanied this loss, then either of these seizures may be expected before a long time elapse, unless the time be deferred by treatment, and diet, and regimen; and more frequently, notwithstanding these means of prevention (see arts. APORALEXY and PARALYSIS).

13. *Loss of speech*, whether complete or incomplete, is generally to be imputed to structural disease, wounds, or fractures, implicating either parts within the cranium, or the nerves in their course to the organs of articulation. Cases of loss of speech, consequent upon apoplexy, or associated with other paralytic states, are very frequent, and are by no means rare as a precursor of a dangerous apoplectic or paralytic attack. When thus present, as the only apparent ailment, the result is not the less to be dreaded. In several cases, for which I have been consulted in the course of my practice, speech was so completely lost, that no articulate sound was produced, the simple vowel-sound *a* and *e* being only omitted, and yet none of the organic, or of the cerebro-spinal functions, and none of the senses, evinced any disorder. In all these, an apoplectic, hemiplegic, or more general paralytic seizure supervened generally in a few weeks or months, owing to the development of latent pre-existing organic lesion. Whenever, therefore, the faculty of speech becomes impaired, or is lost by persons who had previously possessed this faculty in a healthy state, more especially if this change occur in mature, middle, or advanced age, it should be viewed as a form of local or partial paralysis, which is generally followed, at so very remote a period, by a very dangerous form of apoplectic, or of more general paralytic seizure.

14. III. IMPEDIMENTS OF SPEECH—HEMITATIONS OF SPEECH—STAMMERING—STUTTERING.—This affection is generally functional, or of a nervous nature; and may present several forms. These are usually observed in childhood and in early life; whilst incomplete or complete loss of speech, briefly considered above (§§ 13. et seq.), is the consequence of structural lesion or of injury, and is a form of paralysis of a most dangerous nature. Hesitations in articulating sounds, or a momentary impediment in uttering certain words or letters, or a stammering, or repetition of certain consonants, are generally observed from

infancy or childhood, but they may increase or diminish, or even disappear as age advances. They may continue during a long life, or they may occur only occasionally. In this latter case, they are induced or aggravated by fear, anxiety, and various mental emotions. They cannot be mistaken for impairment or loss of the previously healthy power of articulation, which, as stated above (§ 13.), proceeds from slowly-formed organic lesions implicating the origins or course of the glosso-pharyngeal nerves; and which occurs under different circumstances, and is attended and followed by very different phenomena and consequences.

15. The muscles employed in the production of definite vocal sounds and of articulate speech, being actuated by volition conveyed from the brain to these muscles by means of the nerves proceeding from the former to the latter, it necessarily follows that both voice and speech depend on the capability of the brain to generate or exert volition, and of the nerves to convey this act to the muscles. Thus speech, as well as voice, requires for its perfection a due exertion, and a healthy transmission of volition, by means of the nerves, to the apparatus destined to its production; and, if volition be feebly exerted, or imperfectly transmitted to the muscles concerned in articulation, various imperfections of these functions will result. But the complete performance of both voice and speech depends also upon the healthy functions of the lungs and respiratory passages, these functions being modulations of expiration by means of the larynx, tongue, fauces, oral cavity, and lips.

16. Thus it is apparent, as remarked by Mr. BISHOP, that "the mechanism provided for the production of speech comprehends a large assemblage of organs. The most simple vocal sounds require the combined action of the lungs, wind-pipe, larynx, and respiratory muscles; and for articulate language, an additional set of organs must be called into play, namely, the pharynx, hard and soft palates, uvula, tongue, teeth, lips, and nostrils."

17. It is justly observed by Dr. CARPENTER that, "great as is the number of muscles employed in the production of definite vocal sounds, the number is much greater for those of articulate language; and the varieties of combination which we are continually forming unconsciously to ourselves, would not be suspected, without a minute analysis of the separate actions. Thus, when we utter the explosive sounds (explosive consonants), we check the passage of air through the posterior nares, in the very act of articulating the letter; and yet this important movement commonly passes unobserved. We must regard the power of forming the several articulate sounds and their simple combination, as so far resulting from intuition, that it can in general be more readily acquired by early practice than other actions of the same complexity; but we find that, among different races of men, there exist tendencies to the production of different sounds, which, though doubtless influenced in great degree by early habit (since we find that children, when first learning to speak, form their habits of vocalisation in great degree in accordance with the examples amidst which they are placed), are certainly also dependent in part upon congenital constitution, as we often see in the case of children among ourselves,

who grow up with certain peculiarities of pronunciation, not thus derived from imitation, of which they do not seem able to divest themselves."

18. I must refer the reader to Mr. BISHOP for a notice of mechanical contrivances for the production of vocal sounds; but these can never sufficiently illustrate the intonations of voice or the production of articulate speech, or even satisfactorily show what it is that constitutes the essential character or distinction between the vowels, and on what part of the mechanism of the voice the vowel-sounds depend. These sounds, as well as those of the consonants, are formed by so slight changes in the relative position of the several parts of the complex organs of voice and speech, varying in accent and intonation so remarkably with the language, &c., as hardly to admit of any estimate. Mr. BISHOP observes that, "in the application of the theory of vowel-sounds to the mechanism of the human voice and speech, there are two hypotheses which would equally satisfy the conditions for their production artificially. The first is, that the glottis produces the primary, and the air in the pharynx, mouth, and nostrils, the secondary or vowel-quality pulsations. The second is, that the glottis produces the primary, and the membranes of the pharynx, mouth, and nostrils, produce the secondary pulsations of the air." Dr. THOMAS YOUNG observes, in respect of the first of these, that the "reflection of the sound from the various parts of the cavity of the mouth and nostrils, mixing at various intervals with the portions of vibrations directly proceeding from the larynx, must, according to the temporary form of the parts, variously affect the laws of the motion of the air in such vibration."

19. As to the second view, Mr. BISHOP remarks that, "we know by experience that the breath passing through the glottis is thrown into a certain state of vibration, and reaches the cavity of the mouth, which is already so disposed as to present a proper extent of its own membranes to the action of the breath. By these means the membranes are also made to vibrate, and these latter vibrations, coexisting with the original vibrations of the glottis, may generate the vocal sounds." Now the chief objections which may be offered to this view are, that the surfaces of parts, over which the vibrations of air from the glottis pass, are not membranous or are not membranes capable of vibration, but are surfaces constantly changing their configurations by means of the muscles by which they and the subjacent parts are actuated, the vibrations of air thrown out by the glottis being modified or changed by the alteration in the configuration of these surfaces—of the surfaces of those parts between the glottis and the external features—so as to produce the different vowel-sounds, and to pass from one simple vowel-sound to another. Without attempting to proceed further in the consideration of the other simple sounds, or of the physiology of voice and speech, my limits oblige me briefly to notice the more practical part of this subject.

20. Very great ignorance, some mischief, and no little discredit to medical science, have been displayed by the energetic proceedings of some surgeons who have either written upon *stammering* and *stuttering*, or who have officiously meddled with, and injuriously operated upon, certain parts which are in no way implicated in the dis-

order under consideration. It has been supposed by these meddlers, with surpassing profundity, that these momentary or temporary affections arise from some lesion of the muscles of the tongue, or of the *frænum linguæ*, or of the *velum palati*, or of the *uvula*, or even of the tonsils, each acting on his own peculiar inspiration—with a success properly exposed by Mr. BISHOP, and sufficiently manifested to my own observation. It must be very demonstrative of the progress of surgical science to see one surgeon "dividing the muscles of the tongue at its root, cutting at the same time through the *linguales*, the *genio-hyo-glossi*, and *stylo-glossi* muscles, with thin blood-vessels and nerves; or cutting a transverse wedge-shaped slice out of the dorsum of the tongue!" Or another surgeon extirpating the tonsils, which may affect the pitch and the quality of the voice, but which can have nothing to do with stammering! Or a third surgeon, cutting off the *uvula*, which is unconcerned in articulation! Now these pleasant operations have all been done, and may be done again and again under the seductive and perfectly safe (?) influence of chloroform, but what are the results? Let the victims articulate the answer, if they can intelligibly—for I have seen some of them who found this very difficult. For, as I have already noticed in another place, both the *uvula* and the tonsils perform functions necessary to the perfection of both voice and speech; and if these be removed, the pharynx and glottis are insufficiently lubricated, and are liable to experience, in consequence, more or less irritation, often passing into chronic inflammatory action, as have been demonstrated by cases which have come under my observation, and in which these parts had been extirpated. In other cases, where these effects have not appeared, or where the speech has been without huskiness, or any lesion of distinct articulation, the voice has been so much injured as to prevent attempts to sing.

21. There are several *conditions* which combine to produce stammering, each being more or less concerned in the morbid effect. The *first* is imperfect vocalisation, or an insufficient expiration owing generally to an imperfect respiration or to the lungs having been nearly emptied of their due quantity of air at the moment of articulation;—the *second* is an insufficient force of volition, by which the act of articulation is attempted; the *third* is, generally owing to the foregoing, a want of synchronous and appropriate action of one or more of the parts concerned in the production of voice and speech; and *fourth*, an irregular or spasmodic action of some of the muscles engaged in articulation. This last state is generally also a consequence of attempts at articulation being made either without sufficient force of volition, or without due vocalisation, or during an insufficient expiration from defect of air. It follows from the above, that the chief source of stammering is to be referred to the nervous centres—more especially to the seats of volition and emotion, and to the functional condition of the *medulla oblongata*.

22. Dr. CARPENTER has justly remarked the analogy between stammering and chorea, the former being sometimes one of the modes in which the disordered condition of the nervous system in chorea manifests itself. "The slightest disturbance of the feelings is sufficient in most

stammerers to induce a complete perturbation of the vocal powers; the very fear that stammering will occur, particularly under circumstances which render it peculiarly annoying, is often sufficient to bring it on in a predisposed subject; and the tendency to consensual imitation sometimes occasions stammering in individuals (especially children) who never show the slightest tendency to it except when they witness the difficulty in others."

23. That one or more of the *four conditions* which I have stated to be chiefly concerned in the production of stammering actually exists, will appear from what is observed as to the manner in which timidity, fear, and anxiety affect these conditions, and, by thus affecting them, produce in many persons either stammering or stuttering; although they are not subject to these disorders of articulation in other circumstances. On this topic Mr. BISHOP very correctly remarks:—"The emotions which arise in a person when he is about to address an audience, are often so overpowering that the voice loses its natural volume, becomes tremulous, and sometimes inaudible, the respiratory functions are irregular, the flow of ideas is impeded, and the articulating organs perform their office so imperfectly, that he who is generally ready and fluent in conversation, hesitates, stammers, and cannot utter a single connected sentence. Now if persons, who at other times have a perfect voluntary control over the organs of voice and speech, partially lose it under the circumstances just mentioned, *à fortiori* those who have at all times an imperfect control over their articulation will, in similar states of feeling, find their powers paralysed, and their speech more than usually defective."

24. But it is chiefly in childhood and boyhood, when the sensibility and the emotional susceptibility are greatest,—whilst the due co-ordination of those movements of the parts which contribute to correct articulation is either being formed, or is in the course of development, or only recently perfected,—that stammering either commences or is chiefly manifested. At these ages, and more especially in those children in whom the faculty of speech is slowly developed, or appears only at a later period than usual, the emotions are most likely to disturb the force of volition, and with this disturbance, the normal exercise of the intellectual, the respiratory, the vocal, and the articulating functions.

25. Whatever may be the cause or nature of the changes in the brain corresponding to the several emotions, they are propagated to the *medulla oblongata*, and influence the action of the respiratory and the motor nerves of the face, throat, and tongue, as well as other nerves, and through them the muscles they supply. The emotions may thus occasion irregular actions of the parts concerned in articulation: 1st, by causing a momentary spasm or closure of the glottis, and thereby arresting all vocal sound; 2d, by causing irregular action, or by closing the isthmus of the fauces and obstructing the pronunciation of letters and syllables which begin with guttural letters; 3d, by the irregular or spasmodic motion of the tongue, the dorsum of this organ being carried backwards, or brought into contact with the palate, thereby affecting the *lingua-dentals*, *lingua-palatals*, and *lingua-palata-*

*nasals*, and syllables or words commencing with these letters; and 4th, by closing the lips and posterior nares, by affecting the pronunciation of the *labials*, and even also of all the other letters. An acute and experienced observer may readily detect the particular cause of obstruction,—whether the glottis, fauces, the dorsum or tip of the tongue, or lips.

26. IV. THE TREATMENT of stammering must be based upon the result of observation as to the seat of difficulty, or obstruction in the organs of articulation. Dr. ARNOTT proposes that all the words should be connected by a vocal intonation, in such a manner that there shall never be an entire stoppage of the breath. But the difficulty is often at the commencement of a word or sentence, especially when the glottis is spasmodically or irregularly affected; and, as MÜLLER contends, this plan cannot do all that is required, as the impediment often occurs in the middle of words, although it may afford some benefit. The most important remedial means is that much insisted upon by Dr. CARPENTER, and this is to study carefully the mechanism of the articulation of the difficult letters, and to practise their pronunciation, repeatedly, slowly, and analytically. "The patient would at first do well to practise sentences from which the explosive consonants are omitted; his chief difficulty, arising from the spasmodic suspension of the expiratory movement, being thus avoided. Having mastered these, he may pass on to others, in which the difficult letters are sparingly introduced; and may finally accustom himself to the use of ordinary language. One of the chief points to be aimed at is to make the patient feel that he has command over his muscles of articulation; and this is best done by gradually leading him from what he finds he can do, to that which he fears he cannot" (*op. cit.* p. 771).

27. The circumstance of stammerers being often able to sing their words better than to speak them, has been explained by the supposition that, in singing, the glottis is kept open, so that there is less liability to its spasmodic action; but, in singing, the velum palati, and the other parts concerned in articulation, are also much less liable to irregular or spasmodic action, they being brought less into action than in articulation. The difference may, however, as Dr. CARPENTER supposes, be due to the direction of the attention rather to the muscles of the larynx than to those of the mouth. One of the most obvious and important objects in the treatment of stammering is the prevention of any emotional disturbance during the act of speech; "and this requires the exercise of the voluntary powers over the direction of the thoughts, in the following modes:—1st, To reduce mental emotion, by a daily, hourly habit of abstracting the mind from the subject of stammering, both while speaking, and at other times;—2d, To avoid exciting mental emotion by attempting unnecessarily to read or speak, when the individual is conscious that he shall not be able to perform these actions without great distress;—3d, To elude mental emotion, by taking advantage of any little artifice to escape from stammering, so long as the artifice continues to be a successful one." Having mastered the articulation of the difficult letters, and of the words containing them, and having thus avoided or overcome mental emotion, the patient should practise reading and

speaking aloud, slowly, and with due enunciation and intonation, and with a full and free respiration, never allowing the lungs to become too far exhausted of air. Due attention should also be paid to the digestive and excreting functions, and to the improvement of the organic nervous force and of the mental powers, by air, exercise, medical treatment, and diet. Frequent declamation, and reading or reciting aloud such passages as interest the mental emotions, should be practised as soon as the patient has acquired a complete command over his articulation and over the difficulties which mental emotions have occasioned him.

CLASSIF.—PATHOLOGY—SYMPTOMATOLOGY AND THERAPEUTICS.\* (See Preface.)

#### 1. DEFINIT.—The rejection of the contents of

\* *The mechanism of vomiting* has been a subject of discussion with both physiologists and pathologists. Three principal opinions have been entertained on this subject. *MAGENDIE* was of opinion that the stomach was passive in the act, and that the contraction of the diaphragm and abdominal muscles on that organ is the sole cause of the phenomenon. "This view was adopted by *RICHBAND*, *ROSTAN*, and *PIEDAGNEL*; while *MARQUAIS*, *MAINGAULT*, *PORTAL*, *TANTINI*, *GRAVES*, *STOKES*, and *HALL* have embraced more or less contrary opinions." *MAINGAULT* attributed vomiting exclusively to a gradual anti-peristaltic movement and contraction of the stomach. *PORTAL* concluded that this act takes place during expiration, consequently during relaxation of the diaphragm.

That vomiting may take place without the action of the diaphragm, is shown by a case observed by *DRS. STOKES* and *GRAVES*, where vomiting was a principal symptom, but the stomach was found situated above the diaphragm. In a case recorded by *M. LEPINE* (*Bullet. de l'Acad. Roy. de Méd.*, 1844), in which the abdominal parietes having been accidentally laid open in the human subject, and the stomach having wholly protruded itself, it was seen to contract itself forcibly and repeatedly, until, by its own efforts, it had expelled all its contents except gases. The relaxation of the cardiac sphincter is essential to the act of vomiting, for its fibres can resist, by their contraction, the combined force of the expulsores muscles. The retchings or fruitless efforts at vomiting are owing to the contractions of the cardiac sphincter. Vomiting, like other efforts at expulsion of the contents of the natural cavities, is performed by the muscles of expiration, and whilst the diaphragm is relaxed and pressed up upon the lungs by the action of the abdominal muscles.

The immediate causes, or the physiological pathology

of the stomach, with or without retchings, generally symptomatic of visceral or of constitutional diseases, but sometimes occurring independently of them, or of any serious derangement:—*RETCHING* is an ineffectual effort to reject the contents of the stomach, or painful contractile efforts, either before the stomach is evacuated, or afterwards, and when the stomach is empty.

2. *Vomitings and Retchings* are subjects of great interest:—1st, As symptoms of disease:—2d, As a therapeutical indication;—and 3d, as a prominent manifestation, if not a primary or idiopathic state, of serious disorder.—The first of these is considered in the article on SYMPTOMATOLOGY (§§ 130, et seq.), as well as in the history of the several forms of disease: the second is partially noticed under the head of THERAPEUTICS (§§ 40, 43, and 56.), and in the eighth class, and the third order of THERAPEUTICAL AGENTS.—Before, therefore, I proceed briefly to consider vomiting as a chief and prominent affection, requiring to be palliated or allayed, I shall notice the circumstances which appear mainly to require the artificial production of vomiting.

3. I. *VOMITING AS A THERAPEUTICAL INDICATION AND AGENT* has not, in the article just now referred to, owing to the scope and object of that article, been considered so fully as its importance demands. It is more especially required when poisonous or injurious substances have been taken into the stomach; or when the stomach is overloaded by food or drink to an hurtful amount, more particularly when either or both threaten to occasion apoplexy, or any other seizure, or when these attacks actually result from these causes. In all such cases, the selection of the emetic should be suitable to the cause and nature of the evil produced; and always be so energetic as to produce a rapid and full effect.

4. a. *Diseases of the respiratory passages*, especially those attended by spasm, by suffocation, difficulty of breathing, by difficult expectoration, &c., are

of vomiting, may be stated under the following head:—1st, The contact of irritating, poisonous, or unwholesome substances irritate the ganglionic nerves supplying the villous coat of the stomach, and affect the celiac ganglion and adjoining plexus. The morbid impression or irritation is conveyed to the roots of the spinal nerves and chord by the ramifications of the ganglionic nerves to those parts, and is reflected thence, by the motor nerves of expiration, to the abdominal muscles, by what I termed a "reflex sympathy," and *DR. MARSHALL HALL* has subsequently designated a "reflex function."—2d, Irritations, &c., affecting other parts of the body (as stated §§ 18, et seq.), are propagated to the splanchnic ganglia and plexuses to the stomach, and through them to the spinal chord, and are reflected, in a similar manner, by the motor nerves chiefly of expiration, to the abdominal and expiratory muscles.—The vomiting which thus occurs I have denominated from reflex sympathy, because it is only occasional or contingent, and not so constant or necessary an effect as to warrant the appellation of a function.—3d, Impressions made on the senses, or violent emotions, may, through the medium of the pneumo-gastric nerves, affect the ganglionic centre, and either through these latter affect, also, in the way above stated, the spinal chord and motor nerves, &c., or be more directly propagated to both the splanchnic and spinal nerves.—4th, Sea-sickness and vomiting cannot be referred to either of the above categories. They proceed from an impression of an irritating or depressing character—the latter more particularly—made primarily on the semilunar and other splanchnic ganglia and plexuses, and propagated on the one hand to the ganglionic nerves of the stomach, and on the other to the ramifications of these nerves to the spinal nerves and chord, thereby occasioning contractions of the stomach simultaneously with contractions of the muscles supplied by the motor expiratory nerves.

generally much benefited by a suitable emetic and free vomiting. Croup, hooping-cough, asthmatic seizures, spasm of the larynx, and laryngitis, congestion of the lungs, bronchitis, and bronchial catarrh, are severally relieved by emetics. In most of these, ipecacuanha, in a full dose, is the best emetic; but when there is fever or inflammatory action, the potassio-tartrate of antimony may be given, but if it fail of producing vomiting in a short time, a full dose of ipecacuanha should be exhibited. The sulphate of zinc and ipecacuanha, conjoined with capsicum or other warm spices, are most useful when vomiting is indicated during states of vital depression or exhaustion; and in cases of poisoning by sedatives, narcotics, &c.

5. *b.* The *invasion of fevers*, continued or exanthematous, is often most satisfactorily treated by an active emetic; and, as well as in affections of the respiratory passages and organs, the good effect is enhanced by the free promotion of vomiting, and by exhibiting warm diluents, especially the warm infusion of camomile flowers, or demulcents.—*Agues* and other *periodic fevers*, especially *remittent, gastric, and bilious fevers*, are also much benefited by initiating the treatment by an active emetic, and by promoting its effects by these means. Antiperiodic and febrifuge remedies, and cholagogue purgatives exert a more certain effect when they are preceded by free vomiting, artificially produced.

6. *c.* Various *disorders of the digestive canal* are most beneficially treated by procturing free vomiting at the commencement of the disorder or of the treatment. The several forms of *Cyanche* or *Angina*, especially when they embarrass respiration or deglutition, often require a recourse to emetics. In the more malignant states of *Cyanche*, or those characterising *Scarlet fever*, the sulphate of zinc, or ipecacuanha, conjoined with capsicum or other spices, and promoted by the decoction of senega, and by tonics, stimulants, camphor, ammonia, &c. should be preferred to others.

7. *d.* Some forms of *indigestion*, or those arising from accumulations of mucous sordes, or crudities, and torpid states of the biliary formations, as indicated by a foul or loaded tongue, and by morbid appearances of the evacuations, are often the most successfully treated by commencing with an ipecacuanha emetic. All forms of *dysentery*, inflammatory or sthenic, adynamic or asthenic, acute or chronic, endemic or epidemic, simple or complicated, hepatic or scorbutic, derive benefit from free and copious vomiting, especially when produced and promoted by means suited to the peculiarities of individual cases. Ipecacuanha is, however, the emetic which is most generally applicable to dysenteric affections; and next to it the sulphate of zinc. After a free effect has been procured by means of ipecacuanha, this medicine,—so valuable in *dysenteries* and *chronic diarrhæas*, may be continued subsequently, in as large doses as the stomach may tolerate, but preferably in the form of pill, combined with appropriate remedies—narcotics, aromatics, tonics, &c.

8. *e.* *Hypochondriasis* and *Melancholia* are sometimes relieved for a time by an energetic emetic, judiciously selected and exhibited. But it ought, in order to be of service, to be followed by medicines calculated to promote the secretions and ex-

cretions, and to impart tone and energy to the organic nervous system and to the organs which it actuates, by exercise, change of air and locality, and by travelling and occupations which both employ and interest the mind.

9. II. VOMITING AND RETCHING AS PROMINENT AFFECTIONS, OR STATES OR SYMPTOMS OF DISEASE.—Retching or vomiting may be the most remarkable and distressing symptoms, owing—1st, To injurious or poisonous ingesta.—2d, To severe constitutional disease, as at the invasion, or in the course, of severe exanthematous or continued fevers, or of pestilential maladies;—3d, To severe functional disorder or irritation, or structural disease of the stomach itself;—and 4th, To sympathy with disease or irritation in some allied or more or less distant organ. The presence of either vomiting or retching, or of both, necessarily induces the physician to inquire,—1st, As to the exciting causes, manifest or presumed; and 2dly, As to the pathological states to which either or both may be referred.

10. *A.* When a physician is called to a person who has previously enjoyed good health, or who has not complained in such a manner as to indicate a liability to an attack of vomiting or retching, then he should suspect the nature of the *ingesta* as having produced it, and inquire as to the food or drink, or other matters which the patient may have taken; and the matters ejected from the stomach should all be preserved for future examination, if circumstances should arise to require such examination. Where neither food nor drink is the cause, then poisonous matters taken voluntarily or accidentally, or given by others, ought to be suspected, and be carefully and artfully ascertained, and the matters rejected from the stomach carefully preserved and examined by a competent person. If poisonous substances have been taken or given, or are manifested by the character of the vomiting, by the allied symptoms, or by the state of the vomited matters, or by their presence in these matters, the antidotes and other means of treatment described with reference to the individual poisons (*see that article*) will be required.

11. *B.* When the vomitings or retchings are not caused by the ingesta, their *pathological relations* must then receive the necessary attention. In infants and children, as well also in adults, these affections may proceed from hot seasons, owing to bilious or gastric disorder; from a bilio-gastric, continued, or remittent fever; from the invasion of exanthematous fevers, especially scarlet fever and small-pox; and, in the former class of patients, more frequently than in the latter; from disease of the brain or of its membranes. They may be the invasion of the usual forms of cholera, or of gastro-bilious disorder, during summer and autumn; or the very prominent and urgent symptoms of pestilential cholera; or, in warm climates, of hæmagastic or yellow fever. In these climates, also, they may usher in remittent or other fevers and maladies; and in all these, although most severe and even dangerous, as well as the most prominent, manifestations of disease, they are very far from being the disease itself, or even the greatest part of it.

12. *C.* Severe functional disorder, local or constitutional, will occasion vomitings or retchings, as that following dissipation or

(§ 5.), and that occurring at the commencement of the fevers, and pestilential maladies already noticed; but the most distressing attacks of retching and vomiting are often caused by the motions of vessels at sea, and by organic lesions of the stomach itself. Of the former, a more particular notice will be taken in the sequel under the head of SEA-SICKNESS, or vomiting and retching during voyaging by sea; and as to the latter causes, viz. inflammation and structural changes of the STOMACH (§§ 22—95.), the symptoms now being considered, when arising from these lesions, are duly noticed at that place. To what I have there stated, and to the article on the pathology of the DIGESTIVE CANAL (§§ 37—43.), I must refer the reader. But there are other remarks which may be adduced at this place calculated farther to elucidate the history of vomiting.

13. i. VOMITING AND RETCHING FROM ORGANIC LESIONS seated in, or implicating, the stomach. — These lesions have been described at the places now referred to; and, amongst these, ulcerative perforation of the stomach, either commencing in this viscus, or extending to it from structural changes in adjoining parts, has occupied a conspicuous rank. These perforations may give rise, owing to previous agglutination or adhesion of the opposite serous surfaces, to communications—1st, Between the stomach and the substance and vessels and ducts of the liver, owing most frequently to abscess in the latter viscus;—2d, Between the stomach and the pleural cavities and lungs;—3d, Between the stomach and pericardium;—4th, Between the stomach and vena cava;—5th, Between this organ and portal vein;—6th, Between the stomach and external surface of the abdomen;—7th, Between this viscus and the gall-bladder;—8th, Between the stomach, gall-bladder, and duodenum;—9th, Between the stomach and duodenum;—10th, Between the stomach and some part of the small intestines;—11th, Between the stomach and colon;—12th, Between the stomach and peritoneal cavity. Other fistulous communications between parts of the digestive canal and other viscera are met with on rare occasions, and are occasionally attended by vomiting; but they are noticed in their appropriate places. Of the several kinds of perforated communications between the stomach and other viscera now enumerated, the first is most commonly the result of abscess in the liver; although it may arise otherwise in rare instances, as in a case which came under my care where the perforation of the stomach extended far into the substance of the liver. The second is also most frequently the result of an abscess opening into the stomach. The third, fourth, fifth, and sixth, almost in all cases, are referable to perforating ulceration, cancerous or simple, commencing in the stomach. The seventh and eighth forms of fistulous communication are most commonly caused by large gall-stones in the gall-bladder. The ninth, tenth, and eleventh most frequently proceed from cancerous or simple ulceration commencing in the stomach or pylorus. The last of these lesions are caused chiefly by the absence of adhesion takes place in the others, although it is weaker, or more readily separated, in the cancerous or malignant, than in the simple, forms of ulceration. Of these forms of fistulous commu-

nications between the stomach and other viscera, gastro-colic fistula is probably the most frequent. This form has been ably described by Drs. BAXTON and MURCHISON, and references have been given by them to interesting cases, published in medical journals, and to preparations contained in the principal pathological collections.

14. ii. VOMITING FROM GASTRO-INTESTINAL FISTULA.—The vomiting caused by an abscess in the liver, or by abscess from diseased vertebra, opening into the stomach, or by a communication with purulent collections in the pleura or lungs, or in any other situation, may be recognised by the history of the case, and by the purulent characters of the rejected matters. When occasioned by cancerous ulceration, or growths, the vomitings, with the antecedent and attendant symptoms, are described at the places above referred to. But when perforation of the stomach, either from these lesions, or from other ulcerative processes, takes place, then the vomitings frequently assume distinctive characters, which indicate the nature of the mischief. In cases of gastro-colic fistula the matters vomited very frequently indicate, or at least render probable, the existence of lesion from either cancerous or simple ulceration. In a very able memoir on this subject, Dr. MURCHISON has adduced 33 cases, of which 21 were caused by cancer, and 9 or 10 from simple ulceration. As to these he remarks, "that the proportion of cases resulting from cancer is more than double that from simple ulceration; and, as simple ulcer of the stomach is about five times as common as cancer, Dr. BAXTON was not far wrong when he conjectured, 'that its proportion in the malignant disease is at least thrice (and probably six to ten times) as great as in the ulcer.' This accounts for the fact that some pathologists, as ROKITSKY and BOCK, speak of it as a result of cancer of the stomach, but make no mention of it under the head of simple ulcer." Had Dr. MURCHISON consulted what I have stated on this subject in the article STOMACH, and in the chapter on "Ulceration and Perforation of the Stomach," he would not have asserted that pathologists "make no mention of it (gastro-colic fistula) under the head of simple ulcer." This may be true as respects the foreign pathologists whom he has referred to; but if he will turn to p. 919. of the third volume of this work he will find, amongst other remarks, pertinent to this subject, the following:—"The ulceration may be cicatrised, as shown in the article just now referred to, (§ 39.) or it may proceed onwards after adhesions have been formed between the opposite portions of the peritoneal membrane, and thus the ulceration may proceed not only to perforation of the stomach, but also to perforation of a contiguous portion of the digestive canal, as the colon, or to more or less ulceration and perforation of another organ;" and I proceed to further illustrate the subject; and, in the following paragraphs, to describe the commencement and course of ulceration and perforation of the stomach, the several varieties they present, and the symptoms which they occasion.

15. This greater rarity of gastro-colic fistula, as a sequela of simple ulcer, may, according to Dr. MURCHISON, "depend on three causes:—viz., the fact, that simple ulcer is much more rarely met with in that part of the stomach nearest the colon—the great curvature (in 5 only

of 220 cases); and that there is a greater tendency in cancer to contract adhesion to neighbouring parts before perforation; while, at the same time, the cementing matter is of a less permanent quality than the lymph thrown out in the vicinity of a simple ulcer." The absolute frequency of gastro-colic fistula, as a sequela of cancer of the stomach, can only be approximated. DITTRICH observed this lesion in 6 out of 160 cases, or in 3.75 per cent.; Dr. BRINTON in 11 out of 507 cases collected by him, or in 2.17 per cent. That the ulceration generally commences in the stomach, I have shown in the places above referred to, but I have admitted that it may originate in the colon or other parts, and extend by perforation into the stomach. The cases recorded by Dr. MURCHISON fully illustrate this inference. He remarks that, "Out of the thirty-three cases, there is every reason to believe that the disease commenced in the stomach in twenty-six; in four cases there are not sufficient data for forming an opinion on the point; and in three only does the disease appear to have been most advanced in the colon after death." In cases where tubercular disease or abscess finds its way into the stomach or into both stomach and colon, as in very rare instances, when this result has occurred from disease of the kidney or the gall-bladder, the course of the alteration is manifest.

16. iii. THE DIAGNOSIS of *gastro-intestinal*, or *gastro-colic fistula*, depends chiefly on the characters of the matters thrown off the stomach. This topic is partly discussed, especially as respects the antecedent and many of the existing symptoms, in the articles referred to above; but those phenomena which indicate the presence of this fistula have not been so fully described. *Vomiting* is always present, although it sometimes recurs only at intervals. It is often preceded, and attended, by foetid eructations, or by bilious, dark, or grumous matters in the ejected fluids. When there is a free communication between the stomach and intestine, the vomited matters generally are more or less faecal. But where the fistula is long or circuitous, vomiting of faecal matters may not, or only occasionally, be observed. Dr. MURCHISON remarks that out of nineteen cases in which the history was clear, faecal vomiting was observed in eleven, and foetid — perhaps faecal — in three; and he draws the following conclusions: — "1. Faecal vomiting is probably present in all cases in which the opening (except this be very minute) is situated in the fundus, or great curvature, of the stomach, and may also be present when the disease is in the pylorus. 2. In all cases in which food is vomited the opening is at or near the pylorus, so as to preclude the passage of food." In cases of cancer of the pylorus or duodenum, vomiting may be less after the formation of the fistula than before, as the food in the former case may pass into the intestine, into which the fistula opens.

17. Where *gastro-intestinal* or *colic fistula* exists there may be present eructations with a faecal odour, as well as faecal vomitings; or there may be only foetid eructations. Next to faecal vomiting, the presence of indigested food in the stools is an important indication of *gastro-intestinal fistula*. I have long supposed that at least some of the cases of *lientery*, amongst the many which came before me at the Infirmary for Chil-

dren, were actually instances of this form of fistula. As the disease advances, as it usually does, to a fatal issue in the course of several days, (although it is sometimes prolonged to some weeks or even months, with intervals of partial ease,) diarrhoea with indigested matters in the stools soon after they had been taken, or an occasional recurrence of costiveness, emaciation, anæmia, general cachexia, or yellowness of the body, as described in the articles already referred to, are commonly observed.

18. III. VOMITING AND RETCHING FROM SYMPATHETIC IRRITATION. — Irritability of the stomach, so great as to be attended by vomiting or retching, on receiving all, or most kinds of food or drink into the stomach, is often occasioned by vascular erythism, inflammation, or organic alterations of an adjoining or even of a distant organ or part. The vascular excitement of, and determination of blood to the uterus during *pregnancy*, and the death of the fœtus in utero in the advanced months of gestation, are often productive of vomitings or retchings; and organic and inflammatory diseases of the uterine organs frequently occasion the same symptoms, especially in delicate and susceptible females, or when those diseases are of an acute or severe kind. As may be readily inferred, inflammations and organic lesions of any of the allied or adjoining viscera very often are productive of vomiting, the rejected matters consisting, as in the preceding diseases, chiefly of the ingesta, and of watery, ropy, and mucous fluids, sometimes coloured with bile, unless when congestion, inflammation or abscess, may give rise to the discharge of blood or purulent matter from the stomach, or from adjoining parts, communicating with the stomach. Enlargements, morbid growths, or other lesions, in the liver, spleen, pancreas, mesentery, omentum; disease of the diaphragm, or of the gall-bladder and ducts; misplaced or suppressed or retroceded gout; suppression of urine, or retention of this excretion, verminous diseases, &c., severally occasion vomitings when they reach an advanced stage of development.

19. In some serious organic diseases of the brain, vomitings sometimes occur, and occasion, in both children and adults, in the latter especially, much difficulty in determining the true cause and morbid relations of this symptom, which, however, may be readily ascertained in most instances from the history of the case, and by estimating the succession and grouping of the accompanying phenomena. Diseases of the stomach itself, especially of the pylorus, duodenum, and of the intestines, particularly of the small, of the liver and gall-bladder — more especially when the concave surface of the liver is much affected — and of the kidneys, are frequently attended by vomiting; and when gall-stones irritate the gall-bladder or ducts, or are passing along the latter, the vomitings and pain are then very distressing. The irritation of calculi in the kidneys, or in their pelvis, or when calculi are passing along the ureters, produces the same distressing symptoms; but the most urgent and dangerous vomitings occur in obstructions of the bowels, especially of the small intestines, from internal or external strangulation, from intus-susceptions, from inflammations, or from

various mechanical or structural causes of intestinal obstruction, as shown in various places (*see Arts. COLIC and ILEUS, CONCRETIONS, BILIARY AND INTESTINAL, &c.*); more particularly when the vomitings are attended by foetid eructations, and when the vomited matters present a foetid or faecal odour, or a more unmistakable faecal character. In all cases of obstruction, and irritation, of any of the ducts and canals within the abdomen, especially when the obstruction is caused mechanically or by a solid body, the sympathetic occurrence of vomiting is generally very urgent and distressing, although often presenting intervals of comparative ease. In all cases of vomiting and retching, the history of the case should be ascertained as fully as possible.

20. Besides these more strictly local diseases, which are attended by vomitings and retchings, there are several constitutional maladies, especially those adverted to above (§§ 18, 19.), in which these symptoms are of a most prominent character, and proceed from contamination of the blood, acting both on the frame generally and upon the stomach and its allied viscera in particular. No doubt that in all these maladies, whether the choleric and hæmagastic pestilences, or the contamination occasioning malignant puerperal fevers, or that arising from poisoned wounds, inoculation, &c., the morbid impression is primarily and energetically made upon the organic nervous system, the retching and vomiting often following closely upon it; but nevertheless, this impression being made, the alteration produced in the blood aids it, and promotes both by increasing the depression of the organic nervous force, and by irritating the stomach and adjoining parts, thereby rendering the vomitings of a more serious, dangerous, or obstinate character, as evinced in these maladies.

21. IV. VOMITING AND RETCHING FROM SEA-SICKNESS are common to all persons soon after they feel the motions of vessels on the sea, if they have not acquired an immunity from this suffering by habit.

22. i. DESCRIPTION.—In some, vomiting is preceded by a prolonged nausea, with extreme prostration, faintness, vertigo, and apathy. In others, vomiting takes place more or less quickly, after nausea is first felt; and in many the nausea and distressing retchings, with headache, vertigo, and prostration, continue or return at shorter or longer intervals after the stomach has been completely evacuated, but only if the motion of the vessel continues. When the retchings continue or return after free vomiting, a ropy mucous fluid, mixed with more or less bile, is evacuated, owing to the emulgent operation of the retchings on the liver, gall-bladder, and ducts, thereby producing a favourable influence on certain diseases noticed hereafter (§ 25.).

23. The severity and duration of sea-sickness depend much upon the susceptibility of the individual; and the extent of motion to which he is subjected; and, although generally all persons are liable to sea-sickness on first going to sea, yet its severity and continuance are great in proportion to weakness and delicacy of constitution. Usually, however, the sickness either subsides or ceases altogether in a few days; and in previously healthy persons it is followed by a good or craving appetite, and a return of health, although the cause of the suffering may continue. Many

persons who, from frequent or prolonged voyaging, have become exempt from sea-sickness, at least whilst at sea, experience a recurrence of it when they return to sea, after having passed a considerable time on land; but it is usually of short duration, or slight in these persons. Sea-sickness occurring during a short passage, as in crossing the Channel, immediately ceases with the stillness of the vessel, or on landing, vertigo only remaining for a time. Some delicate persons, who are very susceptible of sea-sickness, are also liable to nausea and vomiting from the motion of a carriage, especially while they remain inside, but escape from the sickness when they ride outside.

24. ii. PROGNOSIS.—Sea-sickness, although mentally and physically most depressing, and although both vomitings and retchings are most severe, is generally unattended by danger, and it very rarely terminates fatally. When this event takes place, it is more the consequence of the continued nausea, and of the loathing of all kinds of ingesta, owing to their inducing retchings, and of the resulting inanition, exhaustion and fatal sinking, than of any alteration of structure, or contingent lesion, produced by the severity of the retchings. In all cases, where this species of sufferings is prolonged by severe weather, and susceptibility or peculiarity of constitution, more or less debility, exhaustion, inanition, anæmia and loss of flesh are observed; but generally, as soon as the cause ceases, or even considerably subsides, as on the occurrence of fair weather after storms, or on landing, these effects soon disappear, and are often followed by restored health, or even by an improved state of health, owing to the circumstance noticed above (§ 2.).

25. iii. THE NATURE OF SEA-SICKNESS has been a subject of frequent discussion. The brain, the heart, and the cerebro-spinal nervous system generally, have been severally referred to as the seat of this distressing disorder. That these are more or less affected during its continuance—that the brain and nervous system are impaired in volition and in the vigorous discharge of all their functions, mental and physical, cannot be doubted; and that the heart acts feebly, although sometimes rapidly, but without tone or vigour, is equally manifest, until the retchings and vomitings occasion more or less reaction, accompanied with perspiration, which varies with the severity of the sickness, and the constitution of the patient. But the affection of these—the of the cerebro-spinal nervous system and of the vascular and muscular systems, with the organs and parts more immediately concerned in the act of retching—is the necessary result of the effect produced by the motion of the vessel upon the semilunar and allied ganglia, and the viscera they endow with the organic nervous force. This effect continues until retching and vomiting supervene and occasion more or less reaction according to the constitutional powers of the sufferer. That the primary influence of the vessel's motion on the semilunar and allied ganglia is depressing may be inferred from the distressing sense of sinking referred to the epigastric region, and from the general physical and mental prostration preceding the retchings. That vomiting and retching, each varying in grade and character, follow very powerful depressing influences, is shown by the effects of most sedative and exhausting agents

—whether poisonous, morbid, or infectious—which act more especially or immediately on organs or surfaces endowed by the organic nervous force. It may therefore be inferred, that the vital depression produced by the vessel's motion is the chief cause of the sickness and vomiting, the irritation caused by matters contained in the stomach during this depression merely aiding in developing the retching and vomiting, this act and the evacuation of the stomach affording a slight temporary relief, the depression and sickness still continuing more or less, or for a period, according to the continuance of the cause, and to the constitution and predisposition of the sufferer.

26. iv. THE REMEDIAL INFLUENCE OF SEA-SICKNESS is sometimes remarkable in several diseases, more especially when the sickness is attended by free vomiting, the appetite returning afterwards, and when the patient does not suffer inordinately, or when the suffering is not long continued. In severe *hooping cough*, especially in persons near or past puberty, and even in infants and children, sea-sickness is often of marked advantage. In this complaint, the patient, sufficiently protected from exposure or weather, may be placed in a rowing or sailing boat, when much swell of the sea is observed, and carried out to sea, until vomiting takes place, when a return to land may be directed. In other cases and circumstances, a short voyage in sailing vessels furnishing the requisite accommodations, may be taken with benefit. A similar advantage may accrue in cases of *tubercular consumption*, as I have shown in that article (§ 420.); in *hæmoptysis*; in *spasmodic asthma*; in *chronic bronchitis*; probably in some cases of *chronic diarrhœa* and of *dysentery*, when suitable accommodations are afforded, and in *torpid states of the liver*, &c. In these cases, the influence of nausea in lowering vascular action and removing spasm, and the action of retching and vomiting in emulging the biliary apparatus (§ 21.), and in evacuating mucous accumulations in the bronchi, are of essential service. By this action also congestions of the lungs and liver are removed, or are aided in their removal, and a healthy secretion of bile promoted—circumstances of great importance in several pulmonary, biliary, hypochondriacal, gastric and intestinal diseases.

27. V. THE RETCHINGS AND VOMITINGS which may be viewed as idiopathic or primary, and which are not necessarily connected with inflammation or structural disease of the stomach and allied viscera, although they ultimately, by persistence in their cause, become thus associated, are those which take place in the morning, and which either recur frequently or habitually, and which the patient generally removes for the time with a glass of brandy, or of brandy and water, or of some other favourite liquor. In these cases, morning sickness is the result of exhaustion from previous over stimulation, and for a time is merely functional, but sooner or later it becomes more and more structural. The same form of sickness often follows in the morning heavy suppers, either with or without excessive drinking. The circumstance of a person complaining of sickness or vomiting habitually or frequently in the morning, and more especially if he have recourse to spirits to remove it, before any food can be taken, is most positive evidence of such

person being an incurable drunkard, although he may never have been intoxicated.\* The form of disorder may be considered as allied to *vomiting from sea-sickness* (§§ 21. et seq.), the most idiopathic form of vomiting.

28. When the functions of the stomach are exhausted by the excessive excitations of intoxication, or by the irritation of indigestible or unwholesome food, and more especially by the ingestion of substances which readily enter into the acetous, the lactic, or the vinous fermentations, when received in the weak and exhausted stomach, then pain, vomiting or eructations are produced by the gaseous products, by the acidity, and by the various irritating matters and combinations, resulting from the fermenting substances, which, if they fail in undergoing these processes during the imperfect digestion, experience putrefactive changes, and occasion the same, or even more serious and more obstinate disease.

29. When the digestive processes are impaired or exhausted, owing to general *debility* (see that article, § 15. et seq.), or to inordinate muscular or mental exertions, or to local or constitutional disease, the articles of food most prone to undergo fermentation, as bulky vegetables, raw fruits, fermented bread and liquors, &c., produce an increase of disorder, by the fermentation which ensues, and the frequent repetition of such disorder at last passes into more serious disease, which is characterised by recurrences of retching and vomiting, and by *gastrodynia*, whenever such

\* The following cases will illustrate this. A young man in a large wine merchant's house, and having free access to extensive wine vaults, was seized, after habitual sickness and vomiting in the morning, with most violent pain in all the smaller joints, and especially in the wrists and ankles. He came under my care, when he confessed, that sickness and vomiting every morning upon getting out of bed had continued for three or four years; that it was instantly cured by a glass of brandy, but that he could take little or no breakfast. As soon as he returned to business in the morning, he continued drinking at intervals sherry or port wine or brandy, as either came in his way, and he thus took from two to three bottles of wine, besides brandy every day, unless Sunday, when his supply was not so liberal. He recovered his health, relinquished this habit, and he has for very many years been sober and temperate. He never evinced any symptom of disease of the stomach or liver, and he is the only instance I can recollect of a complete reformation from drunkenness.

A cook in my family was always sick and retching in the morning, and could take no breakfast. Her principal meal was supper; soon after which she retired into her own room, and nothing was known of her until she had partly recovered from her sickness and resumed her morning duties. Upon hearing this I became alarmed at the probable consequences of her after-supper indulgence, and means were devised to prevent her apartment from being fastened on the inside, and then she was there found drunk. These cases are not of infrequent occurrence; but in some instances vomiting is only occasionally present, chiefly in the morning; a chronic diarrhœa, sometimes passing to a fatal dysentery, with diseased liver, taking its place.

Several cases of very young persons, mostly females, who have died from the excessive use of spirituous liquors have been brought under my notice. These were characterised by habitual sickness and retchings in the morning, which were allayed by the accustomed stimulus or by strong tea, but followed, after a longer or shorter period, by enlarged and fatty liver; or by emaciation, chronic diarrhœa or dysentery, with ulcerated bowels; or by the most violent pains in the extremities, of a mixed neuralgic and gouty or rheumatic character, terminating in several of the cases before the age of twenty. In one fatal case, at the age of 17, the growth was remarkably stunted owing to this vice, all the others who had commenced it at an early age being very much under size. In this instance the fatty liver filled almost the whole abdomen, and descended deep into the pelvis, and produced an abdominal enlargement as great as the full period of pregnancy.

disease is aggravated by the ingestion, or commixture of fermentative substances. The connection of fermentation in the stomach with indigestion and vomiting, has been well discussed by Dr. TURNBULL, and although the doctrine of fermentation has been pushed too far by him, there can be no doubt of the importance of giving due consideration to changes of this nature, which certainly take place in the digestive canal, when the nature, the quantity, and the admixture of indigestible, saccharine, and putrescent substances are taken into the stomach during functional or structural lesions of the digestive organs. Persons addicted to the excessive use of intoxicating liquors, experience more or less fermentation in the stomach after the excitement caused by these liquors has subsided; and the products of the fermentation, acting on the exhausted organ, frequently produce that amount of irritation, which is manifested by nausea, retchings, vomitings and gastrodynia, and which the drunkard relieves by a recourse to the accustomed stimulus.

30. VI. VOMITING ATTENDED BY THE DISCHARGE OF THE SARCINA VENTRICULI. — In 1842 Professor GOODSIR described this remarkable production, and since that time many cases of this kind have occurred, most of which have been either observed or referred to by Dr. TURNBULL, of Liverpool. I have not observed more than three instances of this production in the substances vomited since attention was first directed to it, and these occurred in cases of organic disease of the stomach, in which the fermentative and putrefactive processes appeared to have been readily produced. The writer just mentioned has noticed thirty cases of *sarcina ventriculi* recorded by various authors, and has himself observed six. Of these eighteen had terminated fatally. He arranges these cases in four groups: — "1. Cases in which ulcers or cicatrices arising from them, or some other non-malignant disease of the stomach, obstructed the pyloric orifice. — 2. Cases of cancerous disease contracting the pylorus. — 3. Cases in which there was no disease of the stomach itself, but displacement or some other condition obstructing the pylorus. — 4. Cases in which the disorder may have been functional, recovery having taken place more or less perfectly." The analysis of these cases furnishes the following: — the disease is more common in males than in females, in the proportion of twenty-four to ten, and between the ages of thirty and fifty. Of the three cases which I saw two occurred in confirmed drunkards between forty and fifty-five years of age. In all the cases, vomiting was the prominent symptom; flatulent distension, offensive eructations, pain in the stomach, costiveness, emaciation, and anaemia being also present. According to Dr. TURNBULL, the sensation of "something alive in the stomach," was also experienced, but this was not remarked in any of the cases for which I was consulted. Dr. B. JONES found the urine alkaline, and this excretion has, in some instances, contained oxalate of lime and sugar.

31. VII. TREATMENT. — I. TREATMENT OF SYMPTOMATIC VOMITING AND RETCHING. — It is manifest that the treatment of retching and vomiting can only be successfully accomplished by a strict examination of the history of each case, and of its causes, extrinsic and intrinsic;

and by ascertaining the particular category of causes to which each individual case should be referred — whether the vomiting has been occasioned — 1st, By the ingestion of an injurious or poisonous substance (see Poisons); — 2nd, Or by the invasion or accession of a febrile, exanthematous or pestilential malady; — 3rd, Or by disease of the stomach or bowels, or of some adjoining organ or part; — 4th, Or by sympathy with the irritation or structural lesion of a more remote organ; — 5th, Or lastly, by the abuse of intoxicating or stimulating liquors.

32. A. If the vomiting be caused by poisonous ingesta, it is obvious that the means advised in such cases in the article now referred to are required, conformably with the evidence obtained as to the nature of the poisonous substance which has been taken. To this extensive subject I can add nothing to what I have adduced in the article Poisons.

33. B. If there appear any reason to ascribe the vomiting to the invasion of an exanthematous, infectious or pestilential malady, especially when any such is prevalent or epidemic in the same locality, or when the vomiting is associated with shivering or any of the other symptoms of the invasion of any of these maladies, then the treatment advised for the accession of such malady ought to be adopted. (See the treatment recommended on the accession of the CHOLERIC, and HEMAGASTRIC PESTILENCES OF SCARLET FEVER, SMALL-POX, &c.)

34. It should, however, be recollected, that the vomitings accompanying marked vital depression, especially those occurring in, or characterising pestilential and malignant maladies, and in animal or fish poisons, and in contaminated states of the blood, admit not of being cured, or even mitigated, by depressing or sedative remedies, whether narcotic or anodyne, unless exhibited in small doses, and conjoined with stimulants, aromatics, and cordials. Opium, morphia, and their preparations, hydrocyanic acid, chloroform and hydrochloric æther, will produce little benefit unless they be given in the manner now stated. In these cases, opium and hydrochloric æther, when judiciously combined with other means, will sometimes be of service, but the hot spices, warm stimulants and cordials, prescribed in large doses, according to the malignancy of the case will be found the most efficacious. Thus large quantities of capsicum, brandy, and of other powerful stimulants, have been retained by the stomach in malignant and pestilential maladies, whilst sedatives and narcotics have been instantly rejected by it; and even the spirits of turpentine have been retained, both in these maladies and in the last stage of low fevers, as well as in similar states of disease, especially when the blood is contaminated and vital depression is extreme. I have seen these effects in numerous instances, since 1817, when I first employed these substances in the hæmagastric pestilence or yellow fever. In all these diseases the usual means of allaying vomiting had failed, and increased the vital depression, the sense of sinking and mental apathy, and therewith the vomiting; which symptoms generally terminated in a fatal pumping up, or rejection of the contents of the stomach, without retchings, but often with singultus, when sedatives and narcotics were employed.

35. C. It is obvious that the vomitings and retchings caused by inflammatory and organic lesions of the stomach and allied viscera, can be allayed only by means which will remove or alleviate the disease of which the vomitings are merely a symptom. In the less severe of these, a temporary aid may be obtained from the use of hydrocyanic acid, from opiates given with oleaginous demulcents and nitrate of potash, or the muriate of ammonia in very small doses, and from external derivatives. But creosote and the more heating substances, often of service in the opposite states of vomiting, are seldom of service in these. In cases of intestinal disease, the remarks now made are equally applicable; and where strangulation or obstruction from any cause exist in, or otherwise implicate, the intestinal canal, the removal of it is essential to the removal of the vomiting. (*See Arts. COLIC and ILEUS, CONCRETIONS, BILIARY and INTESTINAL, DIGESTIVE CANAL, STOMACH, and INTESTINES, INFLAMMATION and ORGANIC LESIONS, &c.*)

36. D. The retchings or vomitings caused by irritation, inflammation, and organic lesions of distant organs require careful examination and discrimination: and, although these sympathetic vomitings are often allayed, especially by demulcents conjoined with refrigerants and sedatives, or with hydrocyanic acid, or creosote, opiates, &c., yet the treatment should be mainly directed to the particular disease, or structural lesion, of which vomiting is a distressing symptom, whether it be seated in the brain, in the kidneys, uterus, or other part. When the irritating cause is a calculus, or concretion in the gall-ducts or bladder, or in the urinary apparatus, the means advised for these, under their respective heads, and warm anodyne fomentations, tepid or warm baths, are those which are most appropriate, although these may be conjoined, or alternated, with those which are most serviceable in allaying the vomiting (§ 34.). — Creosote is often of much benefit, when the stomach itself and its allied viscera are free from inflammatory and organic disease, and when the retchings are purely sympathetic; but it soon fails as a palliative when the primary or chief disease has not received due attention, or when it remains unsubdued. Moreover, creosote, when given in too large or frequent doses, is apt to increase inflammatory action when it exists, especially if it be of a sthenic or phlegmonous character. When the vomiting is attended by manifest asthenia, or vital depression or exhaustion, creosote, as well as stimulants, aromatics and cordials are frequently very beneficial.

37. E. *The vomitings, &c. attending pregnancy*, especially in the earlier months of this process, will often be palliated or prevented by the above means — by the combination of the alkaline or earthy carbonates with infusions of calumba, cascarrilla, and with tinctures of the same tonics, and with the addition of hydrocyanic acid, or small doses of opium, or of chlorodyne. In this class of cases, fermentation often accompanies the sympathetic irritability of the stomach, and develops this latter state into the act of retching or vomiting. In the more obstinate and severe cases, or when these means prove inefficacious, then creosote in pill or in mixture, combined, according to circumstances, with opiates, alkalies, &c. should be prescribed.

38. ii. *TREATMENT OF SEA-SICKNESS.* — This is a very hopeless subject, yet it is nevertheless one which should not be abandoned, for with care and judgment sea-sickness may be more or less alleviated and its duration abridged. The usual means employed for it are seldom of service and often tend to prolong the nausea, without ultimately preventing the vomiting. It is generally preferable, when the sufferer is young or even moderately strong, to partake of such food and drink as he may prefer, thereby to prevent ineffective retchings; and when free vomiting is accomplished, to take small and frequent doses of a suitable anodyne, in small quantities of fluid. Substances of large bulk, or even in moderate quantity, or gaseous fluids, by distending or filling the stomach, generally bring back the retching and vomiting. During the nausea, or even after it is moderated, the stomach is quite incapable of digesting alimentary substances; therefore their presence in the stomach acts only as an irritant of the weak and susceptible organ, and in a short time brings back the sickness and vomiting. Having, therefore, promoted a free evacuation of the stomach, in the way now advised, small doses, often repeated, of either hydrocyanic acid, or tincture of opium, or chlorodyne, or of chloroform, or of hydrochloric æther, may be given in small quantities of a demulcent mixture, which may be made agreeable by the addition of a few drops of an aromatic cordial. Creosote has been recommended, but its odour is disagreeable to many persons; but, when prescribed for sea-sickness either in the form of pill, or in a demulcent mixture, it should be given in small doses, or not exceeding half a minim for a dose, which may be repeated according to its operation. The demulcent and anodyne medicines may be given in any of the mint waters, especially when the patient is distressed by flatulence and eructations, and any cordial or aromatic may be added if sinking at the epigastrium or vital depression be experienced.

39. Females and delicate persons, subject to sea-sickness, should retire to their cabins immediately on embarking, if the voyage be likely to be longer than a few hours, or to continue during the night. Unless the sufferer be weak, or extremely depressed by the sickness, retchings and vomitings, it is generally preferable for him to keep up and struggle against his enemy, as he will be the more likely to overcome ultimately, and to shorten the duration of the attack. If he have any return of appetite after vomiting, it should be indulged in great moderation, the food being the most digestible within his reach; if sickness and vomiting recur, they will generally be of short duration, and be followed by a return of appetite, which, if prudently indulged, will be generally followed by health. This plan is to be preferred if a long voyage, or one beyond three or four days be anticipated; for, by that time, or not much longer, the evil will cure itself. It is only for the more severe cases, or in short voyages, or for delicate females and weak persons, that the medical treatment advised above (§§ 38.) is either much required, or particularly appropriate.

40. iii. *TREATMENT OF RETCHINGS AND VOMITINGS CAUSED BY DRUNKENNESS AND BY FERMENTING INGESTA.* — The drunkard generally knows well how to remove the morning effects

of his previous indulgence, and he finds the recurrence to his accustomed liquor, or to one still more energetic, to be the most efficacious remedy. But he counts not the ultimate cost, viz., according to the nature of the liquor indulged in, organic disease of the stomach, pylorus, liver, &c.; or chronic diarrhoea, or dysentery, delirium tremens, &c., often complicated with the foregoing. Safer remedies for retchings and vomitings consequent upon DRUNKENNESS are the aerated waters, the compound decoction of aloes with cinnamon water, creosote in pills or in mucilaginous mixtures, and the means advised in the article now mentioned (§§ 15. *et seq.*). When the vomitings are of daily recurrence, it is evident that the only permanent cure is to subject the patient to such restraint as may be legally permitted, seeing that he is incapable of restraining himself. This is, however, one of those forms of moral degradation, against which the laws have no provision, and for which medical aid is rarely of any avail, especially as regards prevention or permanent cure—

"*Hic cum hominibus, non cum Diis agitur.*"

41. Vomitings caused by *excessive fermentation* in the stomach, are generally allayed by medicines which either arrest or neutralise the process, or develope the vital force of the organ, or allay excessive irritability of it, or which operate in more than one of these modes. The sulphite of soda, the alkaline carbonates, the carbonates of magnesia or of lime, calcined magnesia, the citrate of magnesia, the subnitrate of bismuth, the bi-borate of soda, are severally of use in these cases, especially when prescribed in conjunction with tonics, stimulants, and anodynes, and sometimes with narcotics. As the fermentation and the vomitings are generally attended by impaired organic nervous force, as well as by irritation of the digestive mucous surface, tonics and stimulants are required for the former morbid condition, whilst anodynes, especially hydrocyanic acid, or small doses of opium, or of opiate preparations, or of the lupulus, or of hyoscyamus, are appropriate for the latter. In many instances, in addition to a frequent recourse to certain of the above, in varying combinations, other substances which are calculated to remove irritation and to check fermentation, and at the same time to promote a healthy secretion from the stomach, liver, and duodenum, may be given from time to time. Of these the most beneficial are Hydrargyrum cum creth, the pilula hydrargyri, and calomel, and these, according to circumstances, may be given in full doses with opium, creosote, the preparations of hop, &c. Small doses of the nitrate of potash, or of the hydrochlorate of ammonia, given with hydrochloric ether, in mint water, &c., are also beneficial in these cases.

42. In all cases of *retching and vomiting*, referable either to the *abuse of intoxicating liquors*, or to *extreme dyspepsia attended by vomitings*, or to *gastric fermentation*, or to *pregnancy*, attention should not be directed alone to the morbid condition of the stomach, for the vomitings or retchings will not be permanently removed, or they will be liable to recur after a time, if the biliary and gastro-intestinal secretions and excretions be not duly promoted. In all such cases, therefore, having palliated the vomitings, a moderate action should be kept up on the bilio-intestinal functions;

and the means which I have most frequently employed have been the hydrarg. cum creth, or blue pill, or Plummer's pill with soap taken at bedtime, once or twice in the week, and the following draught early on alternate mornings, or every morning, or at bed-time:—

No. 379. R Potasse Bi-carb. gr. xij. ad xvij. — Ammoniac Carbonatæ, gr. vj. — Tinct. Sennæ Comp. — Tinct. Cardamom. Comp. ℥ss. — Infus. Sennæ Comp. ℥ss. — Infus. Gentianæ Comp. ad ℥ss. Mux, et sit Haustus.

To this draught may be added, according to the peculiarities of the case, a dose either of hydrocyanic acid, or of the extract of taraxacum.

43. iv. **VOMITINGS ATTENDED BY THE REJECTION OF THE SARCINA VENTRICULI**, are generally the result of protracted indigestion, attended either with fermentation, or with organic disease, malignant or otherwise, of the stomach or pylorus (§§ 80. *et seq.*). In the majority of these cases the means already advised may first be employed, and if these fail, as they often will in this form of complaint, other more energetic medicines should be prescribed, generally in efficient combinations, viz. camphor, creosote, and small doses of opium, made into pills, with any suitable powder, and with either common tar (pix liquida), or the balsam of Peru. These having been taken for a time, the exhibition of tonics with alkalies, or alkaline carbonates and hydrocyanic acid; or of the sulphites, or the pyroxic spirit, or limewater, or the chlorides, may be tried, conjoined with preparations of either cinchona or cascarrilla bark, or with an infusion or decoction of cedar or pomegranate bark.

44. v. **DIET IN CASES LIABLE TO VOMITINGS, &c.**—*Vomitings*, when palliated or removed, present the greatest difficulties as to the selection of alimentary substances. As a general rule, all such as are liable to readily undergo any of the fermentative processes should be avoided. But most alimentary substances undergo one or other of these processes, whether of an acid, or of a putrefactive, or of a saccharine nature, when mixed with the morbid secretion of the stomach, and when the organic nervous force of this organ is much impaired. Still there are aliments which are much less prone to undergo these changes than others, although much depends upon the peculiar idiosyncrasy of the patient. Frequently the food which the patient most desires in these cases, or for which he feels a relish, will be found the most easily digested or retained. Substances which readily undergo fermentation, as fermented new bread, vegetables, raw fruit, the ingestion of varieties of food, and fermenting liquors should be avoided. In this subject, however, I can add nothing to what I have advanced in the article on INDIGESTION. (See §§ 55. *et seq.*)

CLASSIF.—I. CLASS, I. ORDER. (See Preface.)

1. DEFIN.—Animal parasites are independent organised beings, descended from peculiar animal parents, which require, in order that they may be enabled to complete their development, growth, or reproduction, to take up abode either constantly or temporarily in or upon a second animal organism of a different kind, from which they also derive their nourishment. Human parasites are those which select the human body as this second organism.

2. The above definition is a modification of that given by Dr. KÜCKENMEISTER, in the very able translation of his work *On Animal and Vegetable Parasites*, by Dr. LANKESTER. LEUCKART (*Parasiten und Parasitismus*, in *VIENOBODT'S Archiv*, 1852) remarks, that whenever "an animal is too small and too imperfectly armed to overcome and destroy another living being, upon which its instincts direct it to seek for nourishment, it must be contented with robbing it, by feasting upon its blood, juices, and solid parts." As respects the human body especially, it would be more correct to state, that, whenever the vital force of this body is reduced by disease, inanition, and exhaustion, it is then exposed to the invasion of those parasites which are peculiar to it; and that these parasites are developed and multiplied with a rapidity generally in proportion to the diminution of vital force or of vital resistance to their invasion and multiplication. The only animal parasites which appear in or upon the human body, belong to the classes of insects and worms, and probably also to the infusoria. "As far as we know, these parasites of man are not subject to the attacks of secondary parasites." Many of them are common to man and other mammalia, whilst others are peculiar to him.

3. It has been very justly remarked by Dr. LANKESTER, in his excellent and instructive preface to the work just referred to, that the study of animal parasites involves questions of the highest scientific and practical interest, and that it teaches that, though scientific theories may sometimes be barren of immediate practical results, they cannot fail to free the mind from prejudices which lead to erroneous practice, and even to disastrous results. On this ground, therefore, he refers to some apparently of the least practical topics, with the hope of assisting the reader to understand those generalisations which the subject of animal parasites involves. But however barren the consideration of the generation and reproduction of organic beings may at first sight appear to be, it is of the utmost importance in respect of its ultimate or practical results; and Dr. LANKESTER has done medical men a great service in furnishing them with a succinct and correct summary of the results of the recent researches of Dr. KÜCKENMEISTER and others as to this subject, especially as regards the history of the human entozoa. Dr. LANKESTER justly remarks, that, although it was easy to account for the existence of intestinal worms, by referring it to the ingestion of their eggs, yet a difficulty presented itself regarding hydatids, which evidently had an independent animal existence. Hydatids exhibited no sexes, they produced no eggs, and readily supported the theory of "spontaneous, or equivocal generation." Even as this theory was driven successively from every other part of the animal and vegetable kingdoms, it "found a refuge amongst the strange and paradoxical creatures imbedded in the tissues of man and other animals, far removed from any external influences." The time has, however, at length arrived, when it can be demonstrated, that the cystic worm is no longer to be regarded as the result of a "fortuitous concurrence of atoms," but that it is the offspring of the tape worm, undergoing one stage of its growth, through which it must pass before it can attain to the more dignified development of its parent. X

many cases the cystic worm has the power of developing, at this stage of its growth, a large number of creatures resembling itself, and these have, each of them, the power of developing themselves into tape worms. "The cystic worm—let it be an *Echinococcus*—has originated from the egg of a tape worm, the embryo of which has found its way from the stomach and intestines, through their walls, into the tissues of the body. This worm consists of a vesicle or bag, to which is attached a head, called the 'scolex.\*' In *Cysticercus*, the hydatid of the pig, there is but one scolex, but in *Echinococcus* there are many scolices. Now this scolex, or scolex-head, as it is sometimes called, is the stock or germ—the head—from which all the segments of a tape worm proceed. The cyst of *Echinococcus*, then, has the power of producing a large number of these heads, each of which may grow into a tape worm. The cyst—the original cyst of the worm—is, in the language of STEENSTRUP, 'a nurse.' KÜCKENMEISTER and the Germans call it a mother cyst. But this cyst will produce not only scolex-heads, but other cysts like itself. These are 'daughter cysts;' and these secondary cysts will also produce scolex-heads. They are also 'nurses;' and in virtue of their existence the mother cyst becomes, in the language of STEENSTRUP, a 'parent nurse.' The second cyst may contain, as it frequently does in the *Echinococcus altricarparius* of KÜCKENMEISTER, a third cyst—a 'grand-daughter cyst,' which is also a 'nurse,' and thus on." (LANKESTER, in *Preface to his Trans. of KÜCKENMEISTER, &c.*)

4. Neither these cysts nor scolex-heads have any sex. Nor do they acquire sexuality as long as they remain in the flesh in the hydatid condition; and to this state of the worm Professor HUXLEY applies the term "agamozoid." In order to acquire the conditions necessary to the development of sexual organs, the cystic form of the worm must be swallowed by another animal. "The scolex-head then becomes, in its turn, truly a 'nurse,' and this of a most prolific kind; for, the cyst below being displaced, the numerous segments ('proglottides,' as they have been called) begin to make their appearance. The conditions are now such, that sexes appear; each segment is merely a capsule containing a male and female generative apparatus, and nothing else. Eggs, the result of the union of sperm-cells and germ-cells, are now produced in myriads. These pass into the external world, and, being swallowed and digested, set free the embryos, which again become cystic, as above described." (*Op. cit.* p. xiii.)

5. These phenomena are not peculiar to entozoa. STEENSTRUP observed them in the medusæ, the claviform polypes, the salpæ, and the trematode entozoa. Professor OWEN has also adduced similar cases, in the exposition of his views on "Parthenogenesis," or the successive production of procreating individuals from one ovum, or asexual

reproduction. Not only are there some among the lowest animals, in various stages of development, capable of producing buds, or individuals like themselves, without sexual union, and embryo-bearing eggs, but there are also amongst the articulate, both in the crustacea and insects, females producing eggs, which proceed to the development of perfect animals without any sexual intercourse, or union of sperm cells and germ-cells. Such a phenomenon is so opposed to the general opinion as to the necessity of sexual intercourse for the development of the embryo in the higher animals, that many have not hesitated to express their disbelief in it. Dr. LANKESTER thus expresses himself respecting it:—"Regarding, however, the phenomena of reproduction from the point of view afforded us by the entozoa and other forms of lower animals, we must receive the facts in both cases equally cautiously, and judge according to the evidence. VON SIEBOLD, in his work on 'True Parthenogenesis,' affords good evidence for believing that the queen bee deposits two kinds of eggs, the one of which has come under the influence of the sperm-cells of the male, and the other not. A very curious point in this history is the fact, that whilst both eggs produce young bees, the impregnated eggs produce worker or female bees, whilst the unimpregnated eggs produce male or drone bees. In a recent communication to the Royal Society, Mr. LUBBOCK has shown that species of the entomostraceous crustacean genus *Daphnia* produce living young in all respects like their parents, without any sexual intercourse. It would appear, then, that up as high as the most developed forms of articulate animals, we have evidence that there is no real difference between the functions of reproduction and generation."\* (*Op. cit.* p. xiv.)

6. I. THE ORIGIN OF ANIMAL PARASITES, more especially of the worms which often infest the human body, has long been a subject of speculation among naturalists and physicians. One class of writers believed that these parasites—at least many of them—originated in the endowment of animal molecules with vitality from the parent body, favoured by certain states of the vital forces of that

\* Dr. LANKESTER, for the better understanding of these and other general remarks he has offered, has subjoined the following diagram:—

\* The word "Scolex"—σκόληξ, Worm, or Spulwurm, Germ.—or round worm, was employed by MÜLLER to designate, generically, imperfectly developed forms of tape worm. "The head was the most characteristic part of these creatures, and gradually the term 'scolex' was applied to the heads of all forms of cystic or tape worms. The term scolex has now no generic signification, as the creatures to which it was applied were immature forms of other genera."—(LANKESTER, in *Preface, &c.*)

body, the states originating their organization also promoting their growth and propagation. Since the progress of microscopic research consequent upon the improvement of our instruments, this doctrine, which till then had been gaining ground, has received a signal overthrow, chiefly at the hands of German helminthologists. VON SIEBOLD, one of the most recent and of the ablest of these, remarks on this topic, "that he has gradually arrived at the conclusion, that these parasites do not originate by 'equivocal generation' from substances of a dissimilar nature; and physicians and naturalists thought themselves justified in assuming that the parasitic worms in the intestines of men and animals owed their origin to ill-digested nutriment, or that they were developed in the most widely different organs from corrupt juices. They took it for granted, that certain morbid processes in any organ were competent to give rise to parasites, assuming that the elementary constituents of an organ affected by disease, separated themselves from their natural connection, and not perishing, but transforming themselves into independent organisms, became parasites. It was certainly more convenient thus to speculate, than to endeavour to attain, by patient researches and careful experiments, a secure insight into the hidden workings of nature. It was by the latter method that the hitherto unanticipated development of the sexual apparatus was discovered in many parasites, such as round worms, thread worms, tape worms, and flukes, in which such an immense mass of eggs and young can be generated, that it seems unnecessary to look further for their origin. As to tape worms, it is well known that a single individual is often composed of many hundred joints. Each joint is capable of laying many hundred ova, so that the number of the progeny of a single tape worm is enormous. Dr. ESCHRIEHT of Copenhagen (*Das Physische Leben in Popularen Vorträgen*; Berlin, 1852; pp. 112, 115.) possesses a tape worm expelled by a patient of his, which consists of 1000 joints; and some of the joints contain more than 1000 ova. According to this writer, a careful examination of the reproductive organs of a female *Ascaris lumbricoides* shows the number of ova to be innumerable." (VON SIEBOLD, *Op. cit.* p. 4.)

7. The precise mode in which such an immense brood of these parasites make their way into the interior of animals was long imperfectly understood. It was, however, ultimately ascertained that intestinal worms undertake emigrations in order to reach that animal whose organs are fitted by nature for their habitation. VON SIEBOLD states that the young of the tape worm (which inhabits the intestine of the higher animals only), "leave the place where they were brought forth, or laid as eggs (that is to say, they emerge from the intestine of their parent's host), and seek an opportunity to enter into the intestine of some other creature. It is easy to convince oneself of the emigration of the tape worm, by examining the excrement of animals infested by them, at those times of the year at which they attain their sexual maturity. We then observe that sometimes single joints, or connected series of joints, full of ova, sometimes immense masses of the ova, are passed with the fæces. The same thing holds good with regard to the ova of the *Distomata* that infest the livers of our ruminating animals; their

eggs, after they have been transferred from the liver to the gall-duets, being washed out with the bile into the intestine, and evacuated with the dung. These emigrations of the young of the intestinal worms benefit not only the creatures they infest, but themselves. There are many kinds of intestinal worms in whose eggs the embryo is never hatched, if they remain in the place where they have been laid."

8. The description (German like) given of the accidental, but frequent, ingestion or passage of the ova of parasites into other animals, and the dignifying of this passage into an emigration, as if it were an act of instinct, imparts an air of imagination to what is nevertheless the fact of the frequency of this passage, and of its consequences. This writer states that these parasites "must wander to some other place in order to develop their young, or to allow of the escape of the young already developed in them. These young must then either wait for, or seek, an animal to lodge in, having entered into which, they are capable of attaining sexual maturity. By such emigrations the infested animals are at the same time freed from guests whose increase would be both troublesome and prejudicial. For example, what would happen if the millions of eggs that a single round worm or tape worm can produce were developed and generated in the same intestine in which they were laid? Would not the intestine, after the young had attained their full growth, and brought forth others in their turn, become at last so choked up as to disable this part of the digestive apparatus, so that the whole organism of the unhappy animal must perish along with his parasites." (*Op. cit.* p. 5.)

9. These emigrations and immigrations of the young of intestinal worms, or in less imaginative language, this discharge and passage of their ova from and into other creatures, are very important, though long an unregarded part of the history of their propagation; and numerous facts have been discovered showing that the origin of intestinal worms in the viscera of animals can be readily accounted for according to natural laws, without recurring to the mysterious hypothesis of "equivocal generation." An important circumstance favourable to the preservation and passage of the ova of parasites into animals in which they become developed, is the hardness of the shells which envelope them. Owing to this the germ or embryo of many of them are protected from external injury, and their vitality preserved for many months, and until circumstances admit of their development. After leaving the dwellings of their parents the ova pass into privies, drains, dust-heaps, &c., where, surrounded by more or less moisture, and subjected to various grades of temperature, and contained in manures, and spread on fields and meadows, they are, either in the state of ova or in that of more advanced development, taken with various articles of food into other animals, or they are washed by rains into streams or brooks, and are swallowed in the drink. Many of the young intestinal worms, according to VON SIEBOLD, more or less developed, but still enclosed in their egg-shells, remain quite inactive in their passive emigrations, and it is of course a mere chance whether they reach their goal or not. The young of others, having left their egg-shells, may take a more active share in the process, creeping out of their holes and

corners in wet weather, or in damp mornings, upon plants or grass, and enter animals suited for their habitation and development with the food. By preventing sheep from being driven out in the morning till the dew is off the grass, or from grazing in wet swampy pastures, these animals are so far protected from *Strongyli* and *Distomata*. The origin of the thread worm, known as the *Filaria insectorum*, that lives in the bodies of adult and larval insects, could not be accounted for, and was referred to equivocal generation; especially as they contained no trace of sexual organs. But VON SIEBOLD ascertained that they were not true *Filaria*, but belonged to the peculiar family of thread worms, comprising the genera *Gordius* and *Mermis*; and that these parasites wander away when full grown, boring their way from within through any soft part of the body of their host, and thus creeping out. "These parasites do not emigrate because they are uneasy, or because the caterpillar is sickly, but from that same internal necessity which constrains the horse-fly to leave the stomach and intestine of the horse where he has been reared; or which moves the larva of the gad-fly to work its way out of the boils on the skin of oxen. The larvæ of both these insects creep out in order to become chrysalises, and thence to proceed to their higher and sexual condition." Now this desire to emigrate is implanted in very many parasitic insect larvæ, and the perfect full-grown, but sexless thread worms of insects, are in like manner moved by this desire to wander out of their previous homes in order to enter upon a new period in their lives, which ends in the development of their sexual organs.

10. As some kinds of parasites that have emigrated are never met with below a certain size, so some kinds that have already made their way into the interior of animals are not to be found under a certain size. It is known that many parasites do not enter into the animals in which they are to pass through their further stages of growth, until they have attained a certain degree of development elsewhere. This is particularly the case with such intestinal worms as remain parasitic in the last stage of their existence, viz., that of sexual maturity, whilst the *Gordiaceæ* quit their parasitical life, in order to become sexually mature away from the animal they have infested. During these early wanderings, the worms in question, VON SIEBOLD remarks, commonly undergo a change of form, often accompanied by other phenomena of so highly remarkable and abnormal a character, as to render their metamorphosis or phases of existence almost incomprehensible. By degrees a mass of observations of remarkable metamorphoses of intestinal worms accumulated and formed a complete chaos of seemingly irregular phenomena, until the Danish naturalist, STEENSTRUP, succeeded in evolving a certain order out of this confusion, by the discovery therein of a hidden underlying law of nature, by which all the phenomena that had seemed so devoid of plan could be reduced to order. He named this law the "Alternation of Generations," and advanced two points of difference between it and metamorphosis; the first is, that the young of those animals which come under the former term are not only unlike their parent at first, but remain so; the second distinction is, that this young generation, so dissimilar to the parent animal, brings forth new creatures, which

either themselves or their descendants revert to the original form of the first parent. Whereas, in simple metamorphosis, the dissimilar young pass by gradual changes into the likeness of the parent animal, and until this metamorphosis is complete are incapable of generation. Thus in the alternation of generation the parent animal produces dissimilar young, which STEENSTRUP terms "nurses," whose descendants only take her form. "A most important circumstance which characterises these nurses or 'Agamozoids' physiologically is, that they bring forth young without themselves possessing any real sexual apparatus. These agamozoids, in fact, multiply by division, by external or internal gemmation; they develop within their bodies germs which become new creatures. But these germs do not deserve the title of eggs, nor is the place where they are developed to be called an ovarium, since the germs which VON SIEBOLD distinguishes by the name of 'sporulae,' are not only devoid of the ordinary constituents of an ovum, a vitelline membrane, yolk, germinal vesicle, and so-called germinal spot; but the further development of the germ-body is not preceded by those conditions which are essential to the development of true ova within an ovarium. The organ in which, in certain agamozoids, the 'germs' are formed, cannot therefore be properly termed an ovarium, and I shall distinguish it by the name of 'sporularium.' No 'nurses' present any sexual distinctions, and hence their method of multiplication and propagation, which takes place by means of sporulae formed within sporularia, or by ordinary budding, or by division, must be arranged amidst the modes of asexual reproduction." (VON SIEBOLD, *Op. cit.* p. 13, 14.) I must refer the reader to what this writer further remarks on the topic of alternation of generation, especially as it occurs among the *Trematoda* and *Cercariae*.

11. From his researches, VON SIEBOLD infers that certain sexually matured *Trematoda* — *Monoicum*, *Distomum* — generate young within their sexual organs, which are not developed into sexual individuals similar to their parents in form and structure; but that each embryo is converted into an animal of remarkably different form — into a *Cercaria*-sac, which has the nature of a sexless nurse, since without possessing sexual organs, it nevertheless generates young *Cercariae*. These *Cercariae* again differ from their parents, but gradually become sexually perfect, and in form and structure take the likeness of their grandparents. If we follow these *Trematoda*, which are subject to the alternation of generations, in their wanderings, we shall find that they meet with many obstacles to the completion of their developmental course, which is the entering into the viscera of an animal in which they can become sexually developed. The destruction of the various forms of *Trematoda* by the untoward circumstances to which they are liable, is compensated by the fact that they are furnished by the alternation of generations with the means of greatly multiplying the various developmental stages of their descendants; a sufficient number of individuals always remaining out of the numerous young of the nurses and larvæ, which achieve the propagation of their species.

12. The history of the *Cercariae* explains many phenomena erroneously interpreted by the supporters of the doctrine of equivocal generation. It was

difficult to understand how living entozoa could have originated in the viscera of animals, sometimes in organs deeply seated or cut off from all external communication, and could there propagate their kind; the mode of origin—by equivocal generation—assumed for them, apparently accounting for the circumstance of these entozoa being unprovided with sexual organs. Frequently also, young or imperfectly developed intestinal worms were met with in the substance of organs, and were attributed to equivocal generation, "though in reality these entozoa were in the act either of emigrating, or immigrating, or else were tarrying until the creature they infested should be swallowed by some other animal, when the passive immigration for which they waited would take place. Many wandering parasites are unresistingly suffered to bore their way into and remain in the organs of animals, whilst certain kinds are stopped by becoming enclosed in a coagulable lymph thrown out by the organs they traverse." There are two kinds of cysts connected with parasitic worms: in the one the cyst is thrown out by the parasite itself, as in the case of the *Cercaria*; in the other, the organ in which the encysted parasites lie embedded furnishes the walls of the cyst. In such cysts or capsules are found the most diverse kinds of intestinal worms, whose further course may be very various. "Many of the encysted young of intestinal worms experience no further change, but only remain for a longer or shorter period until such time as they may, together with their host, pass into the intestine of some animal of prey suitable for their future development. To this kind belong the *Cercaria* already mentioned. There is also a small, imperfectly developed, round worm, hitherto always erroneously described as a perfect intestinal worm, under the name of *Trichina spiralis*, which remains a long time in its cyst without either growing or developing sexual organs. This minute *Trichina spiralis* is met with not only in the substance of the muscles of man, but also in the pleura and peritoneum of the most widely different kinds of vertebrate animals, enclosed in oval capsules about a quarter of a line in length." After a certain time of confinement is allotted to this little worm, and its deliverance not effected, it dies and undergoes a process of calcareous degeneration, its form being altered or entirely destroyed. Other encysted intestinal worms succeed in obtaining nourishment through the walls of their prison, and thus go on growing. Those, however, which are intended by nature to attain their sexual maturity only in the digestive organs of certain animals, cannot arrive at this condition in their cysts, and must, notwithstanding their further growth, fail in the attainment of the power of sexual propagation, until the animal they inhabit is devoured by the predaceous creature whose intestine is alone fitted to allow of the passage of these asexual intestinal worms into the last stage of their development. (VON SIEBOLD.)

13. From what has been stated we gather that those young intestinal worms which are developed at a distance from the nidus of their parents succeed, in the end, in reaching those situations where they may repeat the part of their progenitors, and reproduce their kind. The embryo parasites that have only just left their eggs disperse in all directions, so that they may immigrate into other

animals, whenever an opportunity offers. Many thousands of these embryos of necessity never attain their object, owing to the numerous casualties they are liable to. However we may accept the facts displayed in the researches of VON SIEBOLD and others, it by no means follows, that the emigration or immigration of these parasitic animals is the result, as they suppose, of instinct. The parasite having arrived at the full stage of sexual development produces numerous ova, many of which necessarily are so circumstanced, by situation, dissemination, &c., as to admit of their passage through the different phases and metamorphoses of evolution and development: but that these changes, and the emigrations resulting from the circumstances common to all or most of them, admit of the inference that instinct has any thing to do with the phenomena; or that their temporary or continued residences, their journeys or passages from one place or animal to another—their migrations, &c., proceed from their possession of this endowment or principle, or that their migrations and residences are otherwise than altogether passive, cannot be received or credited without further evidence. But, after thus stating a disbelief of the instinctive faculties of these parasites, the facts connected with their propagation and evolution become practically of importance.

14. Instead of viewing the migrations of the embryo or young parasites as passive, and the accidents connected therewith as equally so, VON SIEBOLD considers the former as altogether instinctive, and the latter as stray migrations. But, whilst altogether disbelieving that instinct has any thing to do with the matter, this writer's views deserve consideration. The point of most importance, he remarks, is "that these embryos should select, as their temporary residence, such creatures as will be consumed by those animals, whose intestines served their parents as a habitation and birth-place for their young. But many of these young, immigrated, intestinal worms will die without reaching the last stage of their development, in consequence of their host and involuntary carrier escaping from his natural enemies. Again, many embryos will be led astray by the migratory impulse (?), and pass into animals which never become the prey of those whose digestive canal is their goal." The embryos which thus "fail in their object," are here viewed as "strayed parasites;" and VON SIEBOLD remarks that "the *Trichina spiralis*, which is found in human beings, and which must be regarded as an encysted sexless nematoid worm, can hardly have found its way into the muscular structure of man, except by having gone astray; so also the *Cysticercus cellulosa*, which not unfrequently appears in the muscles and other organs of man, and which is an asexual tænioid agamozoid. The *Cysticercus cellulosa* changes to a sexual tape worm in the intestinal canal of certain mammals; the *Trichina spiralis*, after transportation to another and more favourable situation, will also become sexually developed." Many of the young of the intestinal worms, which only attain the last stage of their development in the digestive canal of the vertebrates, are said, by this writer, to pass, in the course of their wanderings, into the wrong organs [their instincts, I may infer, have not yet been fully developed or perfected?]; for instance, into

the muscular substance, the liver, or the peritoneum; here they remain undeveloped, whilst other individuals of the same brood, which have found their way into the intestines of the same animals, arrive at maturity. "The *Trienophorus nodulosus*, infesting fishes, offers an example of this, developing into a long sexually mature tape worm, in the intestines of pikes and perch, whilst, at the same time, these fishes often harbour other tape worms, which are, however, always sexless, in cysts in their liver. These last must certainly be also regarded as strayed parasites."

15. VON SIEBOLD believes that, in the bodies of vertebrate animals, the small embryos of intestinal worms bore their ways not infrequently through the walls of the bloodvessels, and fall into the current of the circulation, and are carried thus to distant parts. Embryos of intestinal worms, to which the term of hæmatozoa has been given, have often been discovered in the blood of birds, reptiles, and fishes. These hæmatozoa never increase in size, nor become further developed in the blood, but often stick in the small bloodvessels of organs, which afford a more congenial soil for their further growth; and hence appear, on some occasions, worms in the brain, in the spinal marrow, and in the eyeball of man and animals. The *Cysticercus cellulosæ*, the *Cœnurus cerebralis*, and the *Echinococcus hominis* and *veterinorum* have been occasionally found in these situations, and have served as an argument for the doctrine of equivocal generation. "With the migrations and alternation of generation amongst the intestinal worms, two other phenomena are connected, which were formerly quite unnoticed, but which now have been generally observed. In the vicinity of those sexually perfect intestinal worms which, in their wanderings, are subject to the alternation of generations, only eggs, or recently hatched embryos, are met with; but the further stages of development are always wanting, since they first make their appearance after the emigration of the young to other places. Further, many of these intestinal worms, taken whilst in the act of migrating, are never found below a certain size, since they do not commence their wanderings, either as nurses or larvæ, until they have already reached a certain stage of their development." (*Op. cit.* p. 30.) Would it not be more correct to view these evolutions of parasites from germs and ova, and their passages, or passive migrations, during their development, as accidents connected with the numbers generated, and with the locations and transitions of the embryos; their development and sexual perfection being results of favourable circumstances which happen only to a few of the many generated; instead of viewing these migrations and their consequences as events produced by the instinctive endowment which VON SIEBOLD has conferred on these parasites? Whilst the possession of this endowment by these animals may be disputed, the facts adduced by this writer, respecting their origin, development, and alternation of generations, are more deserving belief and consideration.

16. II. THE CLASSIFICATIONS OF INTESTINAL WORMS have been so numerous and so different the one from the other, that an attempt to place them before the reader would not be consistent with my limits and with expectations of utility.

Recent researches, also, have thrown doubts on the principles by which the older arrangements were guided; and the orders, genera, and species of *Entozoa*, which have been found in the animal kingdom, are so numerous as to prevent even a brief notice of them at this place. I must, therefore, refer the reader to the more recent works enumerated in the BIBLIOGRAPHY, and especially to those of Dr. JOY and M. FELIX DUJARDIN. Dr. KÜCHENMEISTER has given a classification of animal and vegetable parasites, which, as far as it refers to the human *Entozoa*, I shall, with some alterations, adopt.

17. I. CLASS, INFUSORIA. — II. CLASS, VERMES, HELMINTHIA. i. Order, PLATYELMIA. A. Sub-order, *Cestoidea*. (a) Genus, *Bothrioccephalus*. (b) Genus, *Tænia*. B. Sub-order, *Trematoda* or *Trematoidea*. (a) Genus, *Monostoma*. (b) Genus, *Distoma*. — ii. Order, NEMATELMIA. A. *Trichocephalus dispar*, *Trichina spiralis*. B. *Oxyuris vermicularis*. C. *Strongylus gigas*, *S. longivaginat*. D. *Ancylostomum duodenale*. E. *Ascaris lumbricoides*.

18. 1st CLASS.—THE INFUSORIA are destitute of high organisation. They are simple, vitellized, membranous structures, which live by mere endosmosis. The vibriones, the *bursaria*, *monades*, and *bedoncs* "are a peculiar attribute of fermenting and putrefying foetid animal substances, or always presuppose a half-dead soil, and do not derive their nourishment so much from living substances as from matters which the living body has expelled, or are in the course of expelling as foreign to it; they are properly only to be regarded as indirectly parasitic upon the human body." FICINUS found sluggish bean-shaped Infusoria  $\frac{1}{1000}$ — $\frac{1}{100}$  of an inch, and sometimes double this size, and of a globular form, in the perspiration of the feet, on the places where the epidermis was thrown off, as well as on the moist folds of the skin in young children; and others have met with them in purulent and foul secretions from the vagina, urethra, bladder, putrescible urine, &c.

19. i. *Trichomonas* (DUJARDIN). *T. vaginilis*. — "*Corpus nodulosum, gelatinosum, lactesum; cauda brevis; flagellum corpore triplo longius. Motus vacillans. Longit.  $\frac{1}{250}$* " This parasite occurs only in women with gonorrhœal discharge, or with an abundant vaginal secretion containing mucous and pus globules, and never in a healthy vaginal secretion. KÖLLIKER and SCANZONI found it in the vaginal — never in the cervical — secretion of both pregnant and unimpregnated women, especially in the creamy and acid secretion, sometimes in the neutral, but never in the alkaline. Owing to its resemblance to the mucous corpuscles, it has been confounded with them. The body of this parasite is 0.01—0.018 millim. in length; the flagellum, 0.028—0.08 millim. in length; and furnished with 4—8 short cilia, in continual movement, which facilitate its recognition. The capability of infection by these Infusoria has not been determined, although very probable.

20. ii. *Denticola hominis* (FICINUS). "*Genus valde dubiosum*" (KÜCHENMEISTER). — This parasite, according to FICINUS, is an aciliated Infusorium, with the mouth on the ventral surface, and probably furnished with a carapace, resembling the *paramecia* and *kolpoda*; but he considers it more allied to the *monodes* and *vibriones*. The genus he believes to be numerous; and he infers

that every mammal has its peculiar species. Dogs and horses, he says, next to man, exhibit these Infusoria in abundance. He states that he found them especially in the interstices of the molars; more rarely on the mucous membrane of the mouth, scarcely in the saliva; but most abundantly where the teeth have been neglected, and in hollow teeth. They adhere, form filaments, and advance between the teeth and gums, pushing between the roots of the former and the latter, destroying their union. These effects are, however, prevented and remedied by the usual operations on the teeth, and by aromatic, tonic, astringent, and antiseptic dentifrices.

21. 2nd CLASS. — a. VERMES, HELMINTHA, are of the greatest importance to both the pathologist and the practical physician. The parasites belonging to this class are destitute of many of the organs possessed by the higher animals. They have no distinct respiratory organ; the oxygen necessary to their existence can only be taken up in their fluid food. Hence they are enabled to exist within the human body, either in its closed or open cavities, or in its tissues. "They constitute the true Entozoa, and furnish no representatives to the series of human Epizoa, although some of them may be destined, in the course of their development, to pass a portion of their lives in water, or perhaps (as in the case of the *Cercaria*) as Epizoa upon other animals. Sexual organs may always be detected in those specimens of these animals which have attained their last grade of development." The senses of sight, smell, and taste are wanting in all these parasites, but their sense of touch appears to be highly developed. The intestinal canal is wanting in the *Cestoidea*. In the *Trematoda* it forms a caecal canal, in which the mouth also performs the functions of the anus; whilst in the *Nematoidea* it becomes a complete alimentary canal, with a mouth, œsophagus, stomach, intestine, and anus. In the tissues of the *Cestoidea* is a tendency to the formation of an envelope of a calcareous nature, which is wanting in the *Trematoda* and *Nematoidea*. These three kinds of true HELMINTHA are characterised — 1st, By a general sense of touch; — 2d, By a vascular system, of four longitudinal lateral canals in the *Cestoidea*, and of a fine network of vessels in the *Trematoda*, which are less distinctly marked in the *Nematoidea*; — 3d, By a muscular system, composed of transverse and muscular fibres, without transverse striæ; — 4th, By the structure of the epidermis, which consists of a homogeneous finely checked substance, closely approaching the character of chitine; — 5th, By the property of giving off a strongly refractive, albuminous substance, in oleaginous drops, when in contact with water; — and 6th, By their scarcely effecting their development without a passive and active migration of their embryos and immature young.

22. b. As to the last of these characters, KÜCHENMEISTER, more rationally than was stated, as shown above, by VON SIEMOLD, remarks that "this migration itself is passive during the embryonal state, and as long as the embryos are still enclosed in the egg-shells or envelopes, during which period they usually emigrate once, passively, into the external world, generally with the excrements of the hosts of their parents; and then again, passively in general, into the intestinal canal of the animal, in which they are to acquire a higher de-

velopment. From the latter moment commences their active migration, by which they seek the situations, usually external to the intestinal canal, in which they are to undergo their metamorphosis into the next higher step or steps of development, which is generally accompanied by an encysting process. Finally, as a general rule, at least as regards the trematoda and cestoid worms, they must afterwards migrate, passively, once more into the intestine of the animal in which they are to attain maturity; that is to say, they must pass with the food of their new and final host into its intestine." (*Op. cit.* p. 4.)

23. c. General pathology shows that the worms cannot effect their active migration without causing some irritation of the regions through which they pass, whether this migration is performed by the youngest brood, as is usually the case, or by the more or less mature animal, as rarely occurs, and chiefly among the *Nematoidea*. The passive migration of all immature parasites into the human intestine takes place without any perceptible morbid phenomena.

24. d. The general prognosis of this class of parasites may be stated as follows: — 1st, The young animals engaged in their migration are the most dangerous; — 2d, Next to these, the migrating mature individuals, which inhabit the intestinal canal, produce the most dangerous symptoms; — 3d, The animals which reside in cysts or closed cavities can become dangerous only when they attain an enormous size; but, when small, they may be present without doing any mischief; — 4th, Most of the mature individuals are more accessible to curative means, than those of lower stages, especially those which live outside the intestinal canal.

25. e. The principles of treatment for the *Helminta* are — 1st, The destruction or removal of the mature worms, and of their progeny; — 2nd, The observation of a rational prophylaxis, founded on the modes of life and migrations of the immature individuals; on the constitution and circumstances, and the habits and modes of life, of people subject to these parasites; and on a knowledge of the nature and peculiarities of the situations in which these plagues are endemic.

26. III. The animals of which I have now to treat belong to the first sub-class of DIESING — *Helminta achæthelmintha*: animalia evertabrata, inarticulata (i. e., extremitotibus articulis nullis prædita), nunc mollia, aut elastica, ebranchiata, setis retractilibus nullis. I have, following VOGT, VIRCHOW, and KÜCHENMEISTER, divided this class into two divisions — i. *Platyelmia*, flat worms; and ii. *Nematelmia*, round or thread worms; and again dividing the first section or order into — 1st, The *Cestoidea*, VOGT; the *Cephalocotylea*, DIESING; or the *Platyelmia colonias exhibentia*, or flat-worm colonies, of KÜCHENMEISTER; — and 2nd, The *Trematoidea*, VOGT; *Myxelminta*, DIESING; or *Platyelmia isolata*, isolated flat-worms, KUCH.

27. i. Order, PLATYELMIA. — *Entozoa solitaria aut composita, androgyna. Corpus depressum vel teretiusculum, molle, organis ad fixandum aptis præditum. Anus nullus; canalis cibarius aut divisus (rarissime simplex), aut nullus. Cavitas corporis non distincta. Metamorphosis in plerisque; larvæ gemmiparæ aut sporuliparæ. (LEUCKART.)*

28. A. Sub-order, CESTOIDEA. — *Cephaloco-*

*tylea*, DIESING; *Platyelmia composita*, aut *colonias exhibentia*, Plattwurm-Colonien, or flat-worm colonies, KÜCHENMEISTER; *Bandwürmer*, tape-worms—*Animalia tomotoca*, per longum plerumque tempus larvæ nutriti juncta et una cum ea corpus elongatum, articulatum, polymorphum formantia. Larva (Scolex, vulgo caput) pyriformis, foveis aut oculis suctoriis quatuor vel duobus instructa, sapisime unciata. Proles sexualis (Proglottides, vulgo articuli) organis externis destituta, embryones uncinulis armatis gignentis. Canalis cibarius nullus. (LEUCKART.)—*Quinque variae inveniuntur in iis metamorphoses*:—1. *Animal maturum* (Proglottis); 2. *Embryones uncinulati* (Grand-nurse, Gross-amme); 3. *Scolex passivum vitam agens sub forma vermis cystici seu Cysticeera*, sub forma *Platyceera*, et sub forma *Acerca*; 4. *Scolex activam vitam agens* (Nurse, Amme); 5. *Strobila*.

29. It is only recently that the *cystici*, or *hydatids*, have been shown to be only a stage in the development of the *Tænia*, and not to be a distinct family among the *Helmintha*. HIPPOCRATES, ARISTOTLE, and many anatomists and physicians up to the times of REDI and HARTMANN—in 1683-5—regarded the *Cysticerci* as *hydatids*; but the distinct animal nature of these was not recognised until the work of REDI appeared; and not fully established until the researches of TYSON were communicated to the Royal Society in 1691. (*Philosoph. Trans.* No. 193. p. 506.) PALLAS, in 1766, stated that all cystic worms are forms of tape worms, and belong to a single species—“*Tænia hydatigena*, cystic tape worm,”—which only presents some differences, especially in the caudal vesicle, according to the animal it inhabits. But neither TYSON nor PALLAS, by the terms *Tænia hydatigena*, or *Lumbricus hydropicus*, given by them to cystic worms, expressed any opinion as to the genesis of these worms, or their derivation from ordinary tape worms. GOEZE, in 1780, and WAGLER, advanced but little the views of TYSON; and, although the subject of cystic worms was considered by ZEDER and RUDOLPH, it made no progress in their hands. At last, in 1842, STEENSTRUP's theory of the alternation of generations made its way, he believing that the cystic worms were early steps in the development of *Helmintha*, which were unknown to him. In 1845, in consequence of STEENSTRUP's discovery, DUJARDIN first asserted that the cystic worms were undeveloped animal forms, and young states of tape worms; and that they were produced from those germs of tape worms which, instead of the intestine, had got into the parenchyma of the body of their host, and under the influence of this unusual dwelling-place, had advanced to the abnormal state of development which is called a “cystic worm.” Simultaneously, VON SIEBOLD, in Germany, expressed the same opinion with DUJARDIN in France. At first, however, VON SIEBOLD inclined towards STEENSTRUP's view, and said:—“In its form, its suckers, and its cirrlet of hooks, the head of the asexual cystic worms possesses such a striking similarity to the heads of certain tape worms, that one is tempted to believe that the cystic worms are nothing else than undeveloped and larvæ-form tape worms.” He subsequently, nevertheless, arrived “at the most decided conviction that the cystic worms are strayed tape worms which have remained undeveloped and become degenerated, and of which the body grew

out in the foreign soil into a vesicle, without developing sexual organs.”

30. In 1850, VAN BENEDEN, the Belgian zoologist, declared the vesicular worms to be larvæ-like, or young states (*scolices*) of *Tænia*, and compared them with the larvæ of *Tætrarhynchus*. According to him, the head of the tape worm (*scolex*) is produced from the egg of the tape worm. If an egg of a tape worm reaches the intestinal canal of an animal in which it may be further developed without interruption, the jointed mature tape worm (*strobila*) immediately grows from the egg in uninterrupted succession; but if it does not reach an intestine of this kind, a longer or shorter period of rest ensues in the further development as soon as it has arrived at the evolution of the head of the tape worm (*scolex*); in this case the anterior part of the head sinks into its inflated hinder part, and it becomes a *Cysticercus*, or a cysticercal animal form. KÜCHENMEISTER, however, finds two errors in this inference. 1st, It is not proved that a tape worm can pass through all the phases of its development in the intestines of its host; and 2nd, And just as little as the caudal vesicle is produced subsequently by dropsical degeneration (DUJARDIN and VON SIEBOLD), does the ready-formed head sink into its inflated hind part, in order to become a *Cysticercus*.

31. As GOEZE had suggested in 1780, KÜCHENMEISTER, in 1851, administered various cystic worms to different animals. For this purpose the latter selected the *Cysticercus pisiformis* of the rabbit, and also the *C. fasciolaris*, and gave the former to the dog and the latter to the cat, and in the intestines of both these animals he “succeeded in rearing *tænia* rapidly approaching maturity.” From these experiments he makes certain deductions, of which the following are the most interesting:—1. The caudal vesicle occurs in all individuals of all species of cystic worms, even though they live in the most various zones and different animals. 2. The universal loss of the caudal vesicle has its analogue in the metamorphosis of many animals. 3. All cystic worms, in the earliest period of their existence, have the head constantly inverted towards the caudal vesicle. 4. The state of rest in which the cystic worms must live in the interior of their caudal vesicle, in order to their development, would be inconceivable, if they had to collect the nutritive fluid for themselves, and did not contain it in them. 5. The cystic worms are not strayed dropsical tape-worm nurses, but tape-worm larvæ furnished with a provisional organ (caudal vesicle), probably being a reservoir of nourishment, and incapable of sexual multiplication, for which there is neither room nor sufficient nutritive material. 6. The cystic worms constitute a necessary step in the development of the *Tænia*. 7. We cannot speak of dropsy or degeneration, and not even of straying, because we do not yet clearly perceive how the brood could get to the dwelling-place of the cystic worm. And 8. *Cysticerci*, when transferred to the intestines of other animals, do not become developed into jointed tape worms, unless the species of *Cysticercus* is suited to the intestines of particular animals; thus, the *Cysticercus pisiformis* was not developed in the intestines of the cat, but it was fully developed in those of the dog. KÜCHEN-

MEISTER asserts that all eminent German zoologists now agree with him in believing "that every cestode worm, and not merely the *Tænia*, pass through a cysticercal state; that the cysticercal larva lives in various parenchymatous organs, and the free scolex (*strobila*) usually in the intestine of a different host; and lastly, that the tape-worm head (*scolex*) is produced in the interior of the previous embryonic body (i. e. the caudal vesicle), and remains enveloped by this until it gains the situation for which it is ultimately destined."

32. But to place beyond all doubt that the cystic worms were necessary steps in the development of *Tænia*, it was also requisite to prove their production from the embryos of the tape-worm brood. "It is true that the six characteristic embryonic hooklets have not yet been detected upon true vesicular worms, but we shall shortly see that the laws of analogy, as well as experiment, afford us a glance into this process." After various experiments, KÜCHENMEISTER proceeds to state that he resolved to resume those experiments with the *Tænia Caninus* in order to obtain the remarkable phenomena of the vertigo in sheep. On the 15th of May, 1853, he obtained the cystic *Caninus*; on the 25th of July mature proglottides of the *Tænia* were passed by the dog, to which the *Caninus* were administered; and these, in order to make the experiment under the most unfavourable circumstances, were administered to a perfectly healthy two-year-old wether, a description of sheep which are usually free from *Caninus*. On the 10th of August the sheep was vertiginous; and on the 13th it was necessary to kill the animal; and in the brain he found fifteen young vesicles of *Caninus*, partly on the surface of the brain, which was reddened by inflammation, partly in the substance of the brain, and even in the ventricles. In January, 1854, six lambs were fed with *Tænia Caninus*. Of these, five became vertiginous in about eleven days. LEUCKART fed, in October, 1853, a colony of white mice with *Tænia crassicolis*. In January, 1854, he examined his mice, and found them infested by cystic worms. KÜCHENMEISTER subsequently proved that, by the administration of mature species of *Tænia*, as far as they were accessible to him, to suitable animals, only the cystic worms belonging to these species can be reared; but not any kind of cystic worm at pleasure. From the concordant experiments of HAUBNER, LEUCKART, VAN BENEDEN, MÖLLER, and himself, KÜCHENMEISTER considers that this much is established:—

33. "1. Mature *Tænia* have hitherto been reared successfully from all vesicular worms administered when a suitable host was selected; thus, from *Cysticercus pisiformis* the *Tænia serrata vera* was obtained; from *Cyst. tenuicollis*, the *Tænia ex Cyst. tenuicollis*; and from *Caninus cerebralis*, the *Tænia Caninus*;—all three in the intestine of a dog; from *Cyst. fasciolaris*, the *Tænia crassicolis*, in the intestine of the cat; from *Cysticercus cellulose*, the *Tænia solium*, in the human intestine; from *Echinococcus veterinorum* (*Scolicipariens* of KÜCHENMEISTER), a *Tænia Echinococcus*, in the intestine of a dog; and from *Cysticercus longicollis Hyperdæi*, the *Tænia crassiceps*, RUD., in the intestine of the dog (LEUCKART)."

34. "2. From the eggs of *Tænia solium* in pigs, from those of *T. Caninus* in sheep and cattle, of *T. serrata vera* in rabbits, of *T. cras-*

*sicollis* in rats and mice, of *T. ex Cysticercus tenuicollis* in sheep and lambs, the corresponding vesicular worms have been reared. The experiments with the eggs of the *Tænia* of *Echinococcus* have hitherto remained unsuccessful."

35. Up to a recent period it was the most general opinion, still entertained by some, that the tape worm (tape-worm chain) was a simple animal, with numerous segments. Nevertheless, some older physicians correctly perceived that tape-worms were not simple, but compound animals. By many, the several segments of *Tænia* were regarded as separate worms; and what DUJARDIN has recently called *proglottides* are described by them in the human tape worms as "*Vermes cucurbitini*." At the same time they fell into the great error of not regarding this chain as produced by a successive formation of joints placed one behind the other from the head, but expressed the remarkable opinion that the tape worm was produced by the adhesion of the individual "*Vermes cucurbitini*" one after the other, by which means the many-jointed body was formed. The opinion that the tape worm was a compound animal—an animal composition—was first expressed by LEUCKART. Soon afterwards, ESCHRICHT and STEENSTRUP expressed this opinion more strongly, and VAN BENEDEN proved it, after DUJARDIN had described the segments of tape worms which occur isolated, as peculiar animals, under the name of *proglottis*.

36. i. *The mature animal, or Proglottis*.—"From the moment that the hindmost segment or segments of a tape-worm colony has become so far developed as to contain the six-hooked brood ready formed and enclosed in the egg-capsules, this segment seeks to break loose, either by itself or in company with several others, in order to continue an independent existence, either in the same place (the intestine of its previous host), or in a different one (in the external world). All this varies according to the species. In *Tænia*, *Tetrarhynchus*, &c., each joint usually breaks loose; in *Bothriocephalus*, a series of joints." In those in which no regular formation of segments exists, no single proglottides or segments can break loose, but only single brood-places, or fragments of the body of the cestode worm with such brood-places; or the eggs must escape singly. The proglottides have for the most part a flat quadrangular form, very similar to the *Trematoda*, and usually a white or yellowish, rarely a reddish or brownish colour; they have neither mouth, anus, nor intestine. "As the eggs possess a much greater diameter than the vagina, they cannot pass through this, but can only escape out of the proglottis, when the vagina acquires a larger opening, by tearing, &c. This takes place sometimes even in the intestine of the first host, and the eggs escape separately into the outer world with the excrements, which then appear as if sprinkled with fine white sand; or immediately without the intestine, where the progress of the proglottis is seen indicated by a white milky streak. Sometimes the proglottis does not burst in either of the above-mentioned places, but gets uninjured into the intestine of a new host, in which case it distributes its brood only after it has been destroyed by digestion. According as the eggs reach the intestine of their host in this way separately, or inclosed in the proglottis, and there-

fore in a mass, solitary or numerous specimens of a cystic, or of the analogous state, are produced within one and the same host." The proglottides thus perform an active migration from the intestine of their previous host, and are passively or contingently transferred into the intestinal canal of a new host. With the dissemination of their brood, their function ceases.

37. ii. *The six-hooked brood, enclosed in separate egg-capsules.*—These are called eggs, although their development differs greatly from that of ordinary eggs. The embryos enclosed in the egg-shells are globular naked vesicles, unlike their parents; the smallest of them measure only 0.022 mill., and the largest, 0.05. They are destitute of any organs, possess an epidermis with a double outline, and usually bear six, but in the *Tetrarhynchi* only four, very small microscopic hooklets on their anterior extremity, so that they carry their destination, that of boring forward through the tissues, as it were, written on their foreheads. The bodies of these small but very dangerous vesicles, whether armed or unarmed, are always capable of motion. The embryos which are destined to migrate into cold-blooded animals are much larger, possess larger hooks, and exhibit distinct movements in the usual temperature of a room. Those destined for warm-blooded animals are much smaller, with smaller hooklets, and exhibit distinct movements only about the temperature of the stomach. (KÜCH.)

38. iii. *The destiny of the six-hooked brood when set free.*—A. *What is the fate of this brood until it reaches its settled dwelling-place external to the intestinal canal?*—As soon as the embryo becomes free in any part of the digestive canal of an animal which suits it, according to VAN BENEDEK, it brings together the central pair of its embryonal hooklets like a wedge, and at the same time, by thrusting and twisting, begins to force them forwards. Having in this way made a little progress, it assists itself further with the two lateral pairs of hooklets. KÜCHENMEISTER supposes that, having thus penetrated into the tissues, they pass into the blood-vessels, and thus they are conveyed either into the liver by the *vena porta*, and remain fixed in the finest ramifications of the blood-vessels, or into the brain, or into other parts. The migration of the young of the *Cestoidæa* to the places where we meet with them as vesicular worms, or in analogous states, takes place in the following way:—

39. 1st. A portion of the six-hooked brood, in all species of *Cestoidæa* may reach their dwelling-place directly and by active migration, by boring their way. 2nd. Others, by an uncertain duration of this migration, reach the vessels of the new host, penetrate these, and are conveyed with the blood to the smallest ramifications, where they (*a.*) either become developed in these ramifications, the walls of the vessel becoming their envelopes; or (*b.*) they migrate passively into the neighbouring tissues, after the rupture of the walls of the vessels, in consequence of the swelling of the embryo; or (*c.*) after being detained in these ramifications they enter anew upon an active migration, passing into the tissues by means of their hooklets, and increasing in size.

40. B. *What further takes place with the embryos when they have come to rest in their new dwelling-places? The third stage of the de-*

*velopment of the Cestoidæa*, consists of the so-called vesicular worms and their analogous asexual forms, "which, in accordance with the alteration which the embryonal vesicle undergoes in the different species of tape worms, and with the different animals infested by them, may be divided into *cysticercal* (vesicular worms), *platyercal* (forms with a flat, inarticulate, tail-like appendage), and *acercal* (or tail-less), forms. It is a common peculiarity of all the three forms here mentioned, that they are cestode-heads produced from the embryonal vesicle, which occur in the interior of the embryonal vesicle, or upon it in a state of rest. We may therefore best comprehend this stage under the name of *resting scolices*." The metamorphosis or transition of the embryos to the resting, and usually *cysticercal* scolices, may be stated as follows:—

41. 1st. "The embryo, still furnished with its six hooklets, begins to swell by the reception of fluid (liquid nourishment), which is secreted from the place in which it has established itself: this is at first a fluid similar to protoplasm, but after the formation of the enveloping cyst, or after the cessation of inflammation, when the creature lives free in the interior of serous cavities, it does not agree so much in its composition with the serum of the blood as with the ordinary products of the secretion of serous membranes." (LUSCHKA.)

42. 2nd. As soon as the embryo has in this way rather rapidly enlarged to a certain size, and arrived at a state of repose, the round vesicle thus formed, when it does not project freely into a serous cavity, and has not fallen into one, surrounds itself with an envelope, which protects it and assists it in procuring repose. These enveloping cysts constitute an absolutely new formation, which is analogous to serous membranes, and which constantly increases in size with the growth of the young cestode vesicle. When, however, the brood of a cestoid worm gets freely into serous cavities, it either never attains to the formation of an enveloping cyst, or does so at a rather late period, and at a time when the young embryo has become a vesicle of very considerable size, and often exhibits the *Tænia* head in an advanced state of development. In places where the young cystic worm again falls into repose, a fresh exudation of plastic matter adapted to the formation of cysts takes place, the walls of the cyst being rich in blood-vessels. (KÜCHEN.)

43. 3rd. By the reception of the secretion of the serous membranes, the young cestoid vesicle swells up. At its anterior end, and at the point where the six embryonal hooklets are situated, a funnel-shaped pit is at first formed, and this gradually penetrates more deeply into the parenchyma of the embryonal body. In the bottom of this pit the first traces of the head appear, whilst the lateral walls of the depression become converted into the body—the central body—of the future cystic worm, and the remaining portion of the embryonal vesicle, which is not inverted, or not implicated in the metamorphosis, becomes the so-called caudal vesicle. This inversion and first formation of the head most frequently commence at the anterior surface of the vesicle, and are seen distinctly in the cestodes of *Ariæa espicicorum*, for in these the six small hooks are placed in pairs at the point of transition of the central body into the caudal vesicle of the worm. The

central body and the head are always developed in the interior of the embryonal vesicle, and during the whole period of the vesicular state the head always has its apex directed towards the caudal vesicle, even when the central body, which encloses the head in the form of a hollow canal, has not sufficient room in the embryonal vesicle, but is pushed out of it. (KÜCHEN.)

44. 4th. From the experiments of HAUBNER, KÜCHENMEISTER, LEUCKART, ROLL, VAN BENEDE, ESCHRICHT, &c., with the various *Tania* which pass through a vesicular condition, the following appears:—According to LEUCKART, at least in experiments with *T. serrata*, we find twenty-four hours after administration the six-hooked embryos in the blood of the large abdominal veins, especially the vena porta; and on the fourth day, in the livers of rabbits to which they have been administered, small, white, clear vesicles of 0.3 millim. in diameter, but rapidly increasing in size, which, on the sixth, are already 1 mill. in diameter. In *T. serrata* the actual embryo, after the lapse of fourteen days, measures 1.5 millim.; in *Cœnurus*, it is about the size of a grain of millet at this period. The small vesicle (the worm), after it has begun to grow clear, acquires, in its interior, numerous large clear enucleate vesicles, which, according to LEUCKART, are similar to sarcode drops. In the parenchyma we recognise a cortical layer, which becomes thinner, and the cells of which are converted into muscular envelopes by fibre-formation, and a medullary layer, in which elastic vesicles or cells occur in great quantity. From the appearance of the medullary substance, the growth of the little worm, which is capable of motion even before the muscular layer is developed, advances with rapidity. Even in the first fortnight, and shortly afterwards, the form of the young cestoid worm varies according to the species. Some, such as the younger *Cœnuri* and *Cystic. cellulosa*, *tenuicollis*, and *fasciolaris*, are spherical; others, such as *Cystic. pisiformis*, and probably also *Cystic. longicollis* and *fistularis*, are oval. Many of those seated upon the surface of organs, projecting into closed serous cavities, wander for a time in the organ, and finally fall into these cavities; the oval forms appearing to wander more than the round ones. About fourteen days after administration, the above changes take place almost universally and in all places. But those individuals which have not found a situation favourable to their development undergo a retrograde metamorphosis, passing "to the state of caseous, granular, or atheromatose masses, in which we may seek in vain for any remains of the embryo, although this certainly is present. Many cases of miliary tubercular disease of particular organs may indeed consist of nothing else than the dead, fatty, and calcified young of worms."

45. 5th. In the third or fourth week, when the young brood of *Cysticercus pisiformis* measures about 2 millim., and that of the *Cœnurus* is of the size of a pin's head, we may see, according to LEUCKART, beneath the epidermis a layer of muscular fibres. Then follows a fatty structure, and then the medullary substance. At the point where the head is to be formed, a turbidity is produced by the aggregation of small nucleated cells, in the interstice between the muscular and medullary layers. This is the first foundation of the head

of the tape worm. Opposite to this turbidity a pit is observed externally, the inner wall of which is formed by the inverted epidermis, and which passes through nearly the whole depth of the globular foundation of the head; this latter appearing like a peg attached to the inner wall of the worm. In the central mass of the head, especially in its upper half, calcareous deposits appear, at first sparingly. Two or four vessels are also observed rising in a tortuous form through the upper part of the lobe, and passing over on the external sac-like envelopes. The vesicle now becomes larger and clearer, and the medullary layer, pushed against its peripheric layers, grows thicker, whilst vessels and calcareous corpuscles make their appearance, especially in the anterior part of the body, between the muscular and epidermic layers, but not in the former, in some cases before, in others after, the formation of the cephalic process. From the time when this process commences, the caudal vesicle ceases its activity in the true *Cysticerci*; its functions are then only passive, serving as a reservoir of nutriment, or as a protection to the head, which requires repose for its further development, and preserving sufficient room for this end. I cannot follow the descriptions of KÜCHENMEISTER and other helminthologists further, as respects the development of the head and its hooklets, &c., but must refer the reader to Dr. LANKESTER's translation of the work of the former, and to the other works referred to in the Bibliography. I may, however, notice the following conclusions of this observer:—

46. 6th. In the progress of the metamorphosis of the six-hooked cestoid brood into scolices, it has been shown that a portion of the *Tania* pass through a true *cysticercal* (bladder-worm) state, whilst the other part, without ever arriving at this state, furnish exactly the same structure (cestoid heads—scolices). This latter part KÜCHENMEISTER has divided into *platycercal* and *acercal* forms.

(a.) True *Cysticerci* occur only in warm-blooded animals, especially mammalia; and *cysticercoid* forms principally in cold-blooded animals.

(b.) The eggs of all *Tania* which pass a *cysticercal* stage are distinguished by the small size of the embryo, and its six hooks, and by their brown hard shell beset with asperities. The eggs of the *Tania* with only a *cysticercoid* phase of development have softer, colourless, transparent shells, are much larger, and contain a much larger embryo, furnished with larger hooks.

(c.) *Tania* with a *cysticercal* phase of development, are inferior to the *platycercal* and *acercal* forms in regard to the length and cylindrical form of the rostellum.

(d.) *Tania* with a *cysticercal* stage possess during this a highly developed *receptaculum capitis*, which forms a part of the future neck, in which, as long as this stage lasts, the head is introverted. The allied *platycercal* and *acercal* forms are destitute of the accumulation of fluid, and of the *receptaculum*.

(e.) If the six-hook cestoid brood gets into animals which are not suitable to it, or into such organs in an animal otherwise suitable, it is destroyed in a very short time, even in the few first days of its immigration; the form of miliary tubercular disease of the organ may thus have frequently occurred. This may be demonstrated by administering mature proglottides to various animals. (f.) & 

number of the cestoid embryos which become developed to the scolex state die, and are destroyed either by a natural or a pathological death. We only know that their life may extend even to several years; but inflammatory processes and alterations of the secretions extending to them from the organs they inhabit, may destroy them more or less rapidly, and change them into masses consisting of cholesterine, calcareous, fatty, suety, and similar substances.

47. iv. *The Scolex passing into activity.*—On this topic I must refer chiefly to recent writers, more especially to KÜCHENMEISTER, and notice merely a few of the more prominent parts of their descriptions. As a general proposition, it is inferred "that the animal infested by cystic worms is usually the source of food, or the prey, of that infested by tape worms." The host of the cystic worm is devoured by a carnivorous predaceous animal, and by this means the cystic worm arrives, together with his previous host, in the stomach of the carnivorous animal. During the process of digestion, the enveloping cysts in which the cystic worms were enclosed, or, if the animal lived free in cavities, these latter, perhaps both, are digested, or opened previously by the teeth of their devourer, when the cystic worm escapes into the cavity of the stomach. Here the worm extends itself; its caudal vesicle collapses. On the caudal vesicle and the middle of the body of the cystic worm digestion begins to act perceptibly. The body at the same time elongates and extends itself, but the head and the short neck are still inverted, as during the cysticercal state. But now the head and neck extend themselves. The head, the hooks still exhibiting the position of cysticercal existence, their apices being directed backwards towards the suckers, and their shafts towards the apex of the head, draws itself, as it were, outwards through the neck, by turning itself inside out. As a matter of course, the whole worm is thus turned inside out; and the margins of the head and neck which were previously turned in, become the free outer sides of the worm. A portion of the *receptaculum capitis* is then cast off, with the body and the caudal vesicle, and a portion wraps itself into the funnel-shaped constriction of the young *Tania*.

48. At various times, sooner or later, according to the evolution and age of the cystic worm, the formation of segments commences and with this, consequently, this stage of development is concluded. It should be recollected that *Tania* cannot be reared from such scolices as do not exhibit perfectly developed hooks. They die immediately. The first transformation of all cystic worms introduced into the intestines of a warm-blooded animal takes place in the same way; but the process stops before the commencement of segmentation, in those cases in which the intestine of the animal in which the vesicular worm has arrived is unfavourable for it and its future development. Thus circumstanced, it lasts but for a short time, no trace of it remaining a fortnight after. The transformation of the platyercal forms into mature Cestoidea takes place exactly like that of the cysticercal forms: in the acercal forms no casting off of a portion of the former embryonal vesicle takes place, but the whole of it is retained, and the formation of segments commences immediately upon it. It still remains to consider—How

the scolex, after entering upon its activity, becomes converted into a tape-worm colony—*Strobila*.

49. v. *The Strobila, or the so-called tape-worm colony.*—"Immediately after the healing of the cicatrix on the neck and on the former *receptaculum capitis*, there commences between the posterior end of the head and this cicatrix a budding forth of the body, produced without sexual propagation, and which becomes constricted into segments by transverse furrows or wrinkles. By the constant production of new masses on this place, that previously formed is continually pushed further back, so that this cicatrix is at last removed to a considerable distance (varying according to the species) from the head. During this time the individual segments increase, and grow in the same ratio as their removal from the head: they at the same time acquire sexual organs, male and female, in each segment, and which are very rarely, and probably never wanting in the colony. Finally, when they have attained a sufficient size and maturity, they produce the embryos (§§ 41, 2.), and last of all cast themselves free in the form of the proglottides (§ 36.). If we were to give a definition of the strobila—it is a series of joints, or individuals, which are formed from the active scolex in the space between the part of the latter that must be called the head proper, and its cicatrised extremity, by a sexual reproduction; which are in direct union with the scolex, and which, when examined from the anterior to the posterior, present asexual segments, half and fully formed sexual segments, and segments engaged in sexual retrogression, the last of which have become truly independent individuals." (KÜCHENMEISTER, *Op. cit.*, pp. 84-5.) Thus we have seen how the segments with their ova and embryonic structures, are developed; and, when they have become the hindmost of the colony, cast themselves loose.

50. My limits admit not of a full description of the minute structure of the fully developed *Tania*. It will be found in the work just quoted. I may, however, briefly state that no digestive apparatus has been found in these animals. Most writers assert that up to this time no nerves have been detected in them; but HUXLEY states that a single ganglion is situated in the axis of the head, and that it sends off nerves to the suckers in some *Tania*. The most important points are the dissemination of calcareous corpuscles in their structure, and the formation of circulating vessels. With the development of the scolex it was seen that a union of four principal lateral vessels takes place in the head, and that smaller branches are given off from these trunks. These vessels probably open outwards near the *receptaculum capitis* or neck, or about the situation of segmental production; but the ultimate structure, connection, and termination of these vessels have not been precisely determined. The muscles consist of transverse and longitudinal fibres, which may be recognised most readily in the neck. The suckers, peculiarly muscular parts, present radiate fibres uniting in the middle of the sucker, under which lies a layer of circular fibres, and the rostellum. It has not been ascertained whether or no muscular fibres run to the hooks of the embryo. The hooks of the *Tania* appear to ride upon the skin or integument, or in slight impressions. The movements of the hooks seem to be produced by changes in parts of the head, particularly of the rostellum. The sexual organs,

both male and female, exist in each segment, in which numerous eggs are produced. A very minute description of these organs,—the penis, testes, vagina, uterus, &c.—is given by KÜCHENMEISTER.\*

51. THE CESTOIDEA, or Cestode worms, occur in man either in the mature state, and then in the intestines only (*Bothriocephalus latus*, *Tenia medioanellata*, *Tenia nana*); or in the larva or scolex state (*Cysticercus visceralis* seu *tenuicollis*, *Echinococcus veterinorum*, seu *scolicipariens*, and *E. hominis* seu *altricipariens*); or lastly, in all known stages of development (*Tenia solium* and *Cysticercus cellulosa*).

52. Genus I. BOTHRIOCEPHALUS = DIBOTHRUM.—This division is abundantly represented in predaceous fishes, more sparingly in piscivorous birds, especially the marine *Raptores*, and rarely in a few mammalia. Of the Terrestrial mammalia inhabiting inland places, man only harbours *Bothriocephali*. KÜCHENMEISTER defines this genus,†

\* The developmental history of the *Cestoidea* may be understood, if considered as follows:—

"i. The mature sexual animal, which is produced by asexual gemination, separates from the colony as soon as it has attained its majority, migrates actively from the intestinal canal of its host into free nature, and thence passively into the stomach of another usually herbivorous animal. It bears within it.—

"ii. The *grand-nurses* or *embryos* produced by sexual, and perhaps by asexual, reproduction, furnished with four or six hooks, which are destined to enter passively into the stomach of a herbivore, and thence to migrate through the body of the latter, either actively, or by the intervention of the vessels, active—passive—actively. (The asexual propagation of the brood in the *Cestoidea* is rendered improbable even by the fact that, in the whole developmental series of these *Cestoidea*, a sexually mature animal has never been met with.)

"iii. The *resting scolex* (nurse), produced by asexual gemination in and by the large six-hooked embryo, still concealed within this embryonal vesicle, or lying beside it enclosed in peculiar cysts, or in closed serous cavities. In its non-gemiparous part the embryonal vesicle acquires, according to the species of cestoid worm, and according to the different hosts (cold or warm-blooded), sometimes the form of a globular vesicle, sometimes that of a flat band-like strip, and sometimes is only just sufficient to cover the scolex, lying quite close upon it, when it really forms nothing but a *receptaculum capitis*. Thus we obtain three forms allied to each other in their degree of development: the *cysticercal* forms (*Ferres cystici*, including *Cœnuri* and *Echinococci*); the *platycercal* (similar to Stein's cestoid worm of *Tenebrio molitor*, and Von Siebold's from *Arion empiricorum*); and the *acercal* (certain embryos of *Tetrarhynch*). Every one of these is a normal form; even the *cysticercal* forms are neither morbidly degenerate, nor become dropsical, nor strayed.

"iv. The resting scolex, transferred into the intestine of an animal, becomes converted into the *scolex passing into activity*. The latter is distinguished from the resting scolex by the extension of the entire body, by the altered position of the adherent apparatus (suckers and hooks), by the attachment in the intestinal canal, and in the cystercal and platycercal forms, by the casting off of the barren portion of the embryonal vesicle, and the formation of a cicatrix on this spot. In the *acercal* forms nothing is cast off, nor is there a cicatrix formation.

"v. The *strobila*—equal the tape-worm colony, budding immediately from the scolex, which has become active by asexual propagation (gemination), is more or less distinctly jointed, and becomes sexually mature posteriorly. Its last segments, which are cast off, and lead an independent existence, are called *proglottides* (i.), and bear within them the embryos produced by sexual reproduction (ii.)." (KÜCHENMEISTER, *Transl.* by Dr. LANKESTER, pp. 53, 54.)

† "Cestoidea, 2 osculis ueterioris, aut 2 foveis marginalibus, oblongis aut longitudinalibus oppositis instructa. Capite subtrigono, depresso, articulo plerumque terni. Pori genitales omnium articulorum in linea mediana animalis et in ejus superficie abdominali siti. Scolexes extra tubum intestinalem in cyttidibus peculiaribus ad verminum platycercorum modum, aut in tubo intestinali animalium minorum aquaticorum statu immaturo viventes; Strobilæ in tubo intestinali animalium

and the species here to be considered, as subjoined\*, and gives the following as the *synonymes* of the species, *Bothriocephalus latus* or *Dibothrium latum*; *Tenia lata*, *T. grisea*, *T. vulgaris*, *T. membranacea*, *T. dentata*, *T. inermis*; *Ténis à anneaux courts*, *T. large*, *T. à épine*; *Lindwürm*, *Baandwürm*, *Baendelorm*: the tape worm, jointed worm, the short-jointed worm.

53. i. GENERAL DESCRIPTION.—The colour of the living worm is bluish white. Specimens preserved in spirits change greatly in colour. The active scolex, or head, is obtusely conical. The two lateral pits (analogues of the sucking discs of *Tenia*) are fissuriform, and appear, like the sucking discs on the feet of flies, rather to effect adhesion than to draw nourishment, which is probably introduced through the entire skin. The neck is more distinct in young than in old specimens, the transverse wrinkling, i.e. segmentation, commencing immediately behind the head. The *strobila*, or jointed body, presents a ventral surface, on which the sexual apparatus opens, the opposite being the dorsal surface. Each segment has four margins—two free lateral margins, slightly undulated, and an anterior and posterior margin, articulated with the upper and lower segments in the colony. The form varies according to the preponderating contraction of the longitudinal or transverse fibres, the breadth, however, being much greater than the length—as three to one. In the central line the segments are thicker (up to 1") and darker; the lateral margins flatter and whiter. The vascular system consists of lateral longitudinal cords, which contain a limpid fluid. A respiratory system and organs of sense are wanting. The sexual organs generally are single in each segment, but they are sometimes double.

54. A. The ova and embryos.—The former exhibit an external hard brittle shell, which often breaks so as to represent operculated ova, like those of the *Trematoda*. From the opercular opening a limpid vesicle emerges, in which, however, KÜCHENMEISTER did not find the six hooklets which VON SIEBOLD considers similar to those in the cirrlets of the *Tenia*. Possibly a part of the eggs of the *Bothriocephali* are not produced with undeveloped embryos, so that the latter are perfectly formed only when free in nature, as the eggs of the *Ascarides*. The resting scolex exists in the fishes, especially marine fishes. In these certain cestode worms live, having a band-like, articulated appendage, but exhibiting no commencement of sexual development. These become converted into mature *Bothriocephali* in the intestines of higher fishes, or of the marine birds of prey.

*aquaticorum rapacium, avium marinarum et mammalium viventes; Proglottides veræ interdum adsunt, interdum adsunt, sæpiissime in longa articulorum serie conjunctæ dehiscentes. Embryones sex hamulis armati; ovulorum testa sæpiissime colorata.*

\* I. BOTHRIOCEPHALUS LATUS = DIBOTHRUM LATUM.—Capit oblongum, inermis; 2 strobilis foveis marginalibus, formam rima aut fissuræ (fente) adaptantibus; colium subnullum; articuli numero circa 2000, maturi omnino latiores (ad 37 millim.), quam longi, scilicet decedentes; pori genitales in linea mediana siti, masculus major et superior, ex quo penis levis et brevis prominet, feminicus minor, posterior inferiorque. Scolex quiescens ignotus; scolex activus cum strobila in hominis tubum intestinalem incolens, longitudinem 7-8 unciarum, secundum Dufardinum ad 20" metres (?) exhibit.

"Embryones 6 uncinulis (?) armati, in ovulis 0.028—33 mill. longis et 0.002 mill. latis, altiplicis, flavo-fuscis, operculo dehiscentibus inclusit."—KÜCHENMEISTER.

Whether the cestode worms are developed in the intestines of fishes in which they are found, or are conveyed there in one or other of the animals on which these fishes feed, in which they had been converted into scolices, after the animal had swallowed the eggs of the mature *Bothriocephali*, is still undecided. Probably the ova and scolices are developed as already described (§§ 37—47.). As the host of the *Cysticercus* is devoured by an animal, in the intestine of which the scolex, being set free, immediately develops itself.

55. B. We have no data as to the production of the *Bothriocephalus latus* in man. This worm has been found in the cat, but is extremely rare in all terrestrial animals. The cat has evidently obtained it from the intestines of fishes, which in sea-ports, and on the sea-coasts, are left in large quantities, and are used as manures. It is difficult, notwithstanding, to account for the presence of this animal in man. The ova from the proglottides of this worm may, however, be introduced into the human intestines by means of vegetables, where the intestines of fish have been used as manures, or where they have been conveyed in sewage water. The passive migration of the embryo into the intestine of another animal, and its conversion in this intestine into an asexual band-like scolex, is much more probable than the development of all the grades in the same intestine, on account of the dissimilarity existing between the embryo and its parent.

56. C. The *Physiological relations of Bothriocephalus* are chiefly its weaker vital manifestations, and the smaller number and less perfect development of its sucking organs, than those of the *Tænia*, which explain its easier expulsion from the intestines. The power of imbibing fluids by the bodies of the *Bothriocephali*, and all *Cestodea*, has been proved by *ESCHRIECH* and others. Transudation takes place in small, pellucid, oleaginous drops (sarcodæ). Whilst the *Nematoda* and *Echinorhynchi* swell up by imbibition, the *Cestodea*, owing to an abundant exudation, experience only a slight swelling from imbibition. Whole series of segments of the *Bothriocephali* pass off spontaneously, but never single segments, as in the *Tænia*. The duration of the life of the former is not known. More than one or two worms of this genus are rarely found in the same intestine, and their length seldom exceeds twenty feet.

57. Genus 2. TÆNIA.\*—i. TÆNIA SOLIUM, and its *Scolex-nurse* = *Cysticercus cellulosa*.

SYNONYMES.—Ταινία, Aristotle; πλατῆια ἔλματι,

\* "Second Order (KÜCHENMEISTER). TÆNIA.—*Caput subglobosum aut tetragonum; acetabulis oculis suctoriis 4, rarisime 6, muscularibus, orbicularibus, symmetricè oppositis, valde contractilibus; rostellò imperforato, retractile, in scolicebus quiescentibus inverso, in actibus s. Tæniis maturis propulso, hamulorum simplici, duplici, aut multiplici corona armata; corpore pterunquæ albo, plano, depresso, bilaterale aut triquetro, articulo (Strobila); articulis maturis androgynis, aut non sexualibus (?), sponte et alio post alium ochiscentibus, Trematode cœcidam similibus (Proglottides); systemate vasculoso perclaro; poris genitalibus lateraliibus; pterunquæ alternantibus, masculo majore et anteriore, femineo minore et posteriore; genitalibus perfectis. Scolices quiescentes et immaturi formam cysti-, platy-, aut aceram incunantes. Scolices activi cum strobila longitudine et latitudine valde variantes. Embryones 6 hamulorum armati, parvuli, pervicaces; ovula in illis qui formam cysticercam incunant, minima, pileolata, flavescenscia, in cæteris majora, leviora et clartora."*

1. TÆNIA WHICH OCCUR IN MAN IN THE MATURE STATE. 1. Tæniasolum, and its scolex nurse = *Cysticercus cellulosa*.—Tæniasolum = *Scolex activus cum strobila*, longit. 4—5 metres = 6—8 ulnarum, latit. ad 13 millim.

Hippocrates; *Lumbricus latus*, Pliny; *Tæniasolum*, Linnæus et Auct. permulti; *T. cucurbitina*, Pallas, Goetze, &c.; *T. vulgaris*, Werner; *T. dentata*, Gmelin, Nicolai; *T. oculis marginalibus solitariis*, Bradley; *T. armata humana*, Brera; *T. lata*, Reinlein; *T. fenestrata*, Delle Chiaje; *T. stigmatibus lateraliibus*, Bonnet; *T. secunda*, Plater; *T. solitaria*, Leske; *T. articulis demittens*, Dionis; *Halysis solium*, Zeder; *Pentastoma coarctata*, Virey; *Vermis cucurbitina*, Plater; Kürbiswurm, Kürbisformiger; bewaffneter Bandewurm; Kettenwurm, Germ.; —Ténie à longs anneaux; T. sans épines; T. de la seconde espèce; le solitaire; ver solitaire; T. bandelotte, &c. The following names are also given it, in common with *Bothriocephalus latus* and *Tænias medicamentata*: le ver plat, Bandelorm, tape worm, jointed worm.

58. *Tæniasolum* presents five steps of development. 1st, The sexual animal—*Proglottis*; 2d, The grand-nurse—*Six-hooked embryo*. 3rd, The resting *Scolex*—*Cysticercus cellulosa*, in the parenchyma, areolar tissue, and cavities of the body; 4th, The active *Scolex-nurse*, that is the *Cysticercus cellulosa*, which will become a *Tæniasolum* in the intestines; and 5th, the *Strobila*, the series of segments of *Tæniasolum* produced by gemmatum from the fourth step.

59. A. THE MATURE TÆNIA.—The name *Tæniasolum* is incorrectly applied to this worm, inasmuch as frequently two or three occur in the same person. Dr. PFAFF has seen seven expelled, KÜCHENMEISTER ten, HELLER thirty, and KLEFFELD counted forty expelled from one patient.

60. (a.) The *Strobila*.—The head, although varying somewhat in size, is seldom larger than the head of a common pin. It is of a blackish-brown colour, especially around the base of the short rostellum, and in the sacs around the base of the hooks, and in and around the sucking discs. The hook-sacs, as well as the hooks, are placed in

Caput = scolex sensu strictiore, breve, antroverium planum, 0.56—0.75—1.0 mill. lat., acetabulis oculis, pterunquæ 4, rarisime 6, muscularibus, orbicularibus, symmetricè oppositis, valde contractilibus; rostellò parvulo 0.4 mill. ad latera nigrescente; hamulorum 22, 24, 28, 26, pterunquæ 26, duplicè ordine, longit. 0.167 quoad majores, 0.11 mill., quoad minores humulos (accusat. LEUCKART), 0.18 et 0.12 secund. nec mensuras, assue et apud hamulorum ex longit. fere similibus, formæ admodum omnino eadè; loculis hamulorum perclaris, nigrescentibus; collo parvulo, fere nullo; corpore antroverium inazime attenuato, dorsum ad 10—14 mill. lat., articulo, poris genitalibus alternantibus, interibus irregulariter; utero ramis 6—10—13, irregulariter alternantibus, densè ramificatis instructo; corporibus calcareis in capite rarioribus (0.004" = 0.065 oval. long. et lat.), in corpore crebrioribus et majoribus (0.005" = 0.012 mill.). Proglottides ad 16 mill. longas et ad 6 lata, ad inferiorem partem crassiores, margine magis tenuis et angulis magis prominentibus, quam ad superiorem partem, ut in aliis Tæniis, oculis 0.016" = 0.035 mill. long., 0.016" = 19" = 0.036 mill. lat.; testa cœcidum crassiore (0.0063 mill.). Embryonibus 6 hamulorum armatis, 0.028—0.032 mill. long. et lat., migratione indigentibus.

"Habitat.—Solitarie aut sodaliter (ad 40 usque) in tubo intestinali hominis, inque terris diversarum; nec in Canè domestico.

"Scolix quiescens = *Cysticercus cellulosa*, verum caudali hand magis (nbi plurimum 15 mill. in diameter) transverse elliptica; corpore inverso, transverse ovato, 8—10 mill. longo. In tubum intestinalium translatum infra 3 menses maturescit. Habitat in teli cellulari totius corporis et nonnullis corporis cavitatibus simul (oculis, cerebro, &c.) imprimis in homine, Sic sergii domestico, rarè in jera, Simi, Cervo, Capredo, Canè domestico (Asachnoti, et miscel.) valde dubiosus in peritoneo Canis domestici et Musci Ratti. Per injuriam a nonnullis Cœnurus cerebri hominis nominatus."—KÜCHENMEISTER.

a double circular series. The one series does not materially differ from the other. As in all the *Tænia*, the points and spines of all the hooks fall in the same circle, or in two circles lying close together, the number and position of the hooks corresponding with the sacs, and varying from 22 to 28. The sucking discs are nearly circular, or somewhat oval, and surrounded by a circular collateral branch of the longitudinal canals, by which a sort of vascular net is formed. Close behind the sucking discs, and near the head, the vessels collect in four main branches, which are united quite at the front of the head by a common transverse branch, thicker than they. In the vessels of various *Cestodea*, VIRCHOW, WAGENER, and others, have seen a sort of ciliary epithelium projecting into them, and moving in the fluid. The calcareous corpuscles reach about to the middle of the sucking discs. They are few and small on the head. The slender neck, of about 6" in length, exhibits no traces of transverse striæ or segmentation. The calcareous corpuscles are somewhat more abundant, and also larger than in the head. Behind the neck commences the true jointed body of the *Tænia*, in which KÜCHENMEISTER counted 825 segments in one specimen ten feet two inches in length. The proportionate size of the segments gradually increases posteriorly, or as they depart from the head—in length from  $\frac{1}{16}$ " to 7". In this species, as in all *Cestodea*, contact with water causes the emission of DUJARDIN'S sarcodæ, in oleaginous drops. The sexual organs appear from about the 280th to the 300th segment, and onwards, from the head, in the median line of the *Cestodea*, at first as a simple brownish-yellow canal, with short lateral off-shoots, towards which two transverse slightly coloured lines (seminal cord and vagina) run from the sides. The alternating *pori genitales* first appear about the 317th segment, and become distinct in the 350th. The sexual organs are more and more developed from the 350th to the 600th segment, where ova commence, which become mature from the 650th to the 700th segments. Both male and female organs generally exist in the same segment, and are minutely described by KÜCHENMEISTER. Each joint when divided presents, 1st, *Epidermis* of a chitinous structure, without calcareous corpuscles; 2nd, *Longitudinal fibres*, with calcareous corpuscles; 3rd, *Transverse fibres*, with few calcareous corpuscles; 4th, *Sexual organs*.

61. B. SCOLEX OF TAENIA SOLIUM.—*Cysticercus cellulosa*. The former is identical with the latter, as proved by the identity of the head in both; by the general and particular circumstances under which *T. solium* occurs, and by converting, by experiments in feeding, *Cysticercus cellulosa* into *Tænia solium*, and the eggs of the latter into *Cysticercus cellulosa*.

62. (a.) The ordinary habitation of the *Cysticercus cellulosa* is the flesh of the pig; and *Tænia solium* is almost entirely unknown where the use of this flesh is avoided, as amongst the Jews and Mohammedans, who strictly adhere to their religious precepts. On the other hand, *Tænia solium* is abundant wherever the breeding of pigs occurs, as in Poland, Hungary, Pomerania, Thuringia, England, &c., "and especially among those engaged in trades which bring them in contact with raw pork, and therefore with raw *Cysticerci*, as butchers, cooks, sausage-makers." KÜCHENMEISTER found

*Cysticerci* in the water used in washing sausages. The direct proof of the identity of this cystic worm and *Tænia solium* is shown by the following experiment upon a murderer condemned to death. Exactly 72, 60, 36, 24, and 12 hours before his execution, 12, 18, 15, 12, and 18 specimens of *Cysticercus cellulosa* were administered to him partly in rice or vermicelli soup of a blood heat, and partly in blood-puddings. The *Cysticerci* had already lain seventy-two hours in a cellar before KÜCHENMEISTER discovered them. The last administered had consequently lain about 130 hours out of the living organism, and he hardly believes that those *Cysticerci* which had lain more than eighty hours were still capable of development, any more than he can believe this to be the case with the *Cysticerci* contained in smoked sausages and hams. On dissection forty-eight hours after execution, he found ten young *Tænia*, of which six were deprived of their hooks, but four distinctly showed the hooks of *T. solium*. The little *Tænia* were 4—8 millim. in length, and had attached themselves by their hooks and proboscis to the intestine, and possessed a small band-like appendage, 2—5 millim. long. The preceding experiment is proof of the conversion of the cystic worms into *Tænia* in the human intestine, and also of the mode of infection. KÜCHENMEISTER is convinced that the scolex of a *Tænia* retains its power of development in its dead host only as long as no putridity occurs.

63. (b.) The further proof of the identity of *T. solium* and *Cysticercus cellulosa* is derived from the structure of the head of the latter. "This cystic worm, like all others, forms a vesicle the size of a pea or very small bean, with a little white head in its interior, from which the true scolex may be evolved by pressure. This scolex bears a head with four, and sometimes six, sucking discs (the latter especially in the human brain), round which the vascular system runs, and collects into two longitudinal canals on each side. The short rostellum bears from twenty-two to twenty-eight hooks, placed in a double crown. Besides these, the head exhibits a sparing brownish-yellow, or blackish-brown pigment," and five sacs round the stems of the hooks. The neck is very short, poor in calcareous corpuscles, opaque, and colourless; the body is wrinkled, abounds with calcareous corpuscles, and the head is inverted into it as long as the caudal vesicle is alive and uninjured. After the death of the worm the head becomes everted. (See also § 46. *et seq.*)

64. (c.) *Proofs of the conversion of the six-hooked embryos enclosed in the eggs of Tænia solium into Cysticercus cellulosa*.—KÜCHENMEISTER, in 1851, expressed the opinion that the pig infects itself with *Cysticercus cellulosa* when it meets with the eggs and proglottides of *Tænia solium* upon the pastures; and in 1853 VAN BENEDEEN administered *T. solium* to two pigs, and thereby rendered one pig measly. The following year KÜCHENMEISTER fed three sucking-pigs, on the 7th, 24th, and 26th of June and 2d of July, with segments of tape worms, partly given off spontaneously and partly artificially expelled. On the 13th of July they were again fed with artificially expelled segments. "One of the pigs was killed on the 26th of July, and exhibited young *Cysticerci* corresponding with the days of administration, of which the largest individuals formed vesicles of the size of a hemp-seed, with a central turbidity, *i. e.* *Sco-*

commencement of a head. The second pig was killed on the 9th of August, when thousands of *Cysticerci* were found in all parts of the body; the largest individuals were as large as peas, and exhibited a distinct head, whilst the smallest were only of the size of a hemp-seed. The third pig, which was killed on the 23rd of August, was uniformly set, throughout all parts of the body, with *Cysticerci* of various degrees of growth and development. The largest were almost perfectly developed; others resembled those last described. He undertook the examination of a weighed piece of the flesh, and found 133 *Cysticerci cellulosa* in 4½ drachms of it. If we calculate from this quantity the number of *Cysticerci* which would have existed in 1 stone, or one-fifth cwt. of the pork, we obtain the great number of 88,000 individuals in this weight. A fourth pig of the same litter, to whom no *Tenia* had been administered, exhibited no traces of *Cysticerci* on dissection." (KÜCHENMEISTER, *Op. cit.* 121, 21.)

65. LEUCKART repeated and confirmed the above experiment, and recognised, in the mode in which *Cysticercus cellulosa* is developed from the embryo of *T. solium*, exactly the same type as that above described as the type of the formation of the so-called *Cysticerci* in general. It may, however, be noted, that this worm acquires the vesicular form, and becomes covered with a vascular net, rather early, and at a time when no trace of the head can be observed. The first appearance of the head commences in *Cyst. cellulosa* soon after the seventh week, at which time the embryo is about 2.5 millim. in diameter.

66. (d.) The *Scolex* of *Tania solium*, *Cysticercus cellulosa*, has hitherto been found in the most various muscles; in the muscles of the heart, in the cellular tissue, in the brain, and in the eye of man. In these it acquires various forms and sizes, according to the space afforded for its development. In the ventricles of the brain and eye, its caudal vesicle attains even the size of a walnut, and remarkable forms. The size and form of the *Cysticercus* are determined chiefly by excess of nourishment, and by softness, looseness, and other properties of the tissues in which it occurs. The form is not material, the nature of the worm is the same.

67. (e.) The symptoms it produces differ with its seat or position. It is almost harmless in the subcutaneous cellular tissue. In muscles it often occasions but little inconvenience. In the muscles of the heart, however, it may cause softening and other organic lesions. But its situation in the deeper muscles, even in the muscles of the heart, admits not of diagnosis. The situation of this *Cysticercus* in the eye is very important.—a. It has been found between the conjunctiva and the sclerótica, where it is of least serious occurrence, as it may easily be removed by operation, as in cases recorded by HÖRING, ESTLIN, BAUM, and others.—b. In the anterior chamber. It was first seen in the living subject by SÖMMERING and SCHOTT; and in the posterior chamber by VON GRAEFE.—c. In the vitreous humour by the last-named writer and others.—d. In the retina and under the retina, in very rare cases. In these latter situations this cystic worm has been detected during life chiefly by means of the ocular speculum of HELMHOLTZ. In most of these cases, partial or complete loss of sight by the affected

eye, squinting, movements of the worm, inflammation of the structures, followed by partial disorganisation, and a greenish tint of the vitreous humour, were the symptoms chiefly observed. In rare instances only were tape worms present, or *Cysticercus* present in other parts of the body.—e. *Cysticercus cellulosa* in the human brain seldom occurs, and as seldom can be recognised during life, unless, conjoined with cerebral symptoms, vertigo, &c.—f. *Cysticerci* are observed in other parts of the body, or *Tania solium* has existed at an earlier period of the life of the patient.

68. ii. *TENIA MEDIOCANELLATA*\* (KÜCHENMEISTER).—DESCRIPTION. (a.) The epidermis of the animal is distinct, soft, consisting of delicate decussating lines, without calcareous corpuscles. Underneath are longitudinal fibres, running through the whole body of the animal; these, as well as the next layer of transverse fibres, contain the calcareous corpuscles embedded in them. The size of the sucking discs, which are quite black, gives the head of this *Tania* a considerable bulk. Transverse vessels run through the space between the sucking discs, and from these a branch runs to and around the discs, until the four longitudinal vessels are developed from them in the neck; these vessels becoming thicker as the segments increase in size. The segments, which have a great tendency to increase in breadth, are at first 1 millim. in length, and about three in breadth. Afterwards, also, the breadth predominates over the length for a considerable space. But this proportion does not continue downwards, and segments of 1—1½ in. of length and only 3—4 lines in breadth are met with. That the last segments or proglottides have a tendency to pass away without feces is beyond a doubt; but this also takes place with *T. solium*, although more rarely. The segments usually pass when the patient is standing, and passing along the thighs, occasion a moist and cool sensation, and are found creeping over the surface.

69. (b.) This *Tania*, when artificially expelled, breaks off close to the neck. After the lapse of about ten weeks from this expulsion, a fresh passage of proglottides takes place. From the spontaneous passage of these without feces it may be inferred that the reproduction and growth of the segments are extremely rapid, and that the animal must be more injurious to its host than *T. solium*.

\* "*Tania matura*.—Species longissima (ad 13—14 ulnas longa), latissima, crassissima. Capite interwi, permagno, ad 2 millim. lat., valde nigrescente; acrobabulis 4, permagnis (ad 0.367" = 0.829 millim. long. et 0.259" = 0.711 millim. usque lat.).

"Systemate vasculoso: in capite simpliciter, quam in *T. solium*; Corpore calcar.: ad 0.012 millim. in capite, ad 0.018 millim. in articulis magnis, magisque numerosis, quam in *T. solium*. Rostellum nullum. Collum perbreve, sed distinctius, quam in *T. solium*. Articuli posteriores latissimi, ad 17 millim. lat. et ad 9—14 millim. long. crassi; poris genitalibus irregulariter alternantibus. Proglottides permagne et pervivaces, rarissime sponte et sine fecibus humanis ex ano decedisse, agratumque valde perturbantes; in maxima sua vetustate 25—30 millim. long. et ad 7 millim. lat.

"Uterus permultos ramos (ex utroque latere usque ad 30) in margine libero claviformes, non amplius dendritice, ad summum bifurcatim divisos, inter se parallelos. Ovula magis ovalia, laeviora, et clariora, quam in *T. solium*, ad 0.036 millim. longa et 0.028—33 lata. Testi crassa uti in *T. solium*. Embryones 0.028—32 millim. longi, 0.023—26 lati.

"*Scolex quiescens ignotus. Fortasse in sine aut hinc, fortasse in animal. inferior. oviductum.*" — KÜCHENMEISTER.

KÜCHENMEISTER mentions a case in which the number of proglottides, which passed almost daily, amounted, in the aggregate, to upwards of 100 feet in 80 days; and that in the course of this time  $\frac{1}{4}$  foot of tape worm was passed and regenerated each day. The internal irritation of the rectum and anus, produced by these segments when forcing their passage, and the unpleasant clamminess they occasion, especially by the deposition of their eggs, which often also occurs at this time, and which appear like to a white moist sand, are very distressing to the patient. In the case just referred to, from 5—15 proglottides passed daily from the patient with the fæces; and as these immediately laid their eggs, the fæces looked as if sprinkled with white sand.

70. (c.) The *Scolex* is unknown. In Dresden it cannot be rare, as this *Tenia* is not uncommon there. It is not improbable that the cystic worm belonging to this species may occasionally occur amongst the specimens pronounced to be *Cysticercus cellulosa*. This point might have been determined by feeding pigs with the eggs of this *Tenia*. An intelligent patient, from whom KÜCHENMEISTER expelled this *Tenia* by means of his preparation of the extract of pomegranate root, states that he had observed his *tania* soon after dining frequently, at an eating house, on raw beef steaks and green salad and radishes. The scolex was either seated in the beef, or in mollusca in the salad or on the radishes. "The embryos resemble in size and structure those of *T. solium*. Their migrations are unknown." Its habitat appears to be in Europe and Africa.

71. VARIETY\* from the Cape of Good Hope. —A number of segments of this *Tenia* were expelled by pomegranate bark, and like *T. medio-canellata* were very difficult of expulsion. They were destitute of head and neck. Its total length must be at least 6—10 yards. Its segments are very thick, white, and fat; in the mature state more than one inch in length, and 3—5" in breadth, and extremely massive. They are distinguished by having a longitudinal ridge along the whole of the mature and immature segments. This *Tenia* is rich in cholesterine. Mr. ROSE, who sent the segments to KÜCHENMEISTER, states that the migrations of the six-hooked embryos and the scolices are unknown, that it is impossible that the latter should live in the flesh of pigs, as the worm was obtained from a Hottentot, and the Hottentots, like the Jews and Mohammedans, eat no pork. A thick *Tenia* occurs in Abyssinia, among Mohammedan inhabitants. The Hottentots probably brought this tape worm with them from the Caffre wars, in which they enjoyed themselves amongst the cattle of the Caffres. The scolex probably lives in their cattle and sheep. May not the scolex have been a *Cysticercus tenuicollis*?

72. iii. *TENIA NANA* † (BILHARZ; VON SIE-

\* "Nihil notum, nisi Strobilæ pars posterior. Articuli per totum corpus, cristâ longitudinali præditi, crassi, et longi. Pori genitales marginales alternantes. Uterus et ovula simillima illis *Tenise* medio-canellatæ. Versimilimum est, strobilam mihi notam proliferatam esse a *Tenise* medio-canellatæ scolice quodam 6 oculis ornato."  
—KÜCHENMEISTER.

† "Corpus filiforme, depressum; Caput anticè obtusum, collum versus sensim attenuatum, acetabulis subglobosis, rostellò pyriformi uncinulorum bifidorum corona armatum. Articuli transversi; cirri unilaterales, ovula

nold).—This small filiform *Tenia* has broad and perfectly developed segments, and a large quadrangular head, at the angles of which the round sucking discs are placed upon globular elevations. The head is flat in front, and gradually diminishes in breadth, and passes into a long slender neck, which is followed by segments which become broader, until at last the hinder segments are three or four times the width of the head. These *Tenia* occupy only a limited space of the ilium. The ova are globular. The six hooklets of the embryo *Tenia* are distinctly seen in the fresh ova. From the number of the *Teniae* found, and their very small size, KÜCHENMEISTER has believed this worm to be a *Tenia echinocoelus*.

73. iv. SYMPTOMS AND DIAGNOSIS OF THE MATURE CESTOIDEA OCCURRING IN THE HUMAN INTESTINE, OF BOTH BOTHRIOCEPHALI AND TENIÆ.—KÜCHENMEISTER remarks that the stronger the patient is, the less the irritability of his system, the more regular his appetite and food, the fuller and richer his nourishment, the fresher his colour, the less he is inclined to diarrhœa, to anæmia, and chlorotic symptoms, the less does he complain of tape worm. According to most writers, chlorotic or anæmic symptoms are increased by the great appetite of the tape worm for proteinic substances, calcareous salts, and fat; and according to the degree of the symptoms are also the complaints of the patient. SEEGER gives the following statement of the frequency of particular symptoms in 100 cases of tape worm:—In 68 instances nervous affections and general or partial convulsions occurred, —epilepsy, hysteria, abdominal spasms, convulsive cough, dyspnoea, melancholy, and hypochondriasis. In 49 cases nausea, with faintness and vomitings, was present; in 42, various pains in the abdomen; in 33, disordered digestion and irregular states of the evacuations; in 31, irregular appetite and voracity; in 19, habitual or periodical hemiparesis; in 17, sudden colic; in 16, sensations of undulatory movements in the abdomen up to the chest; in 15, vertigo, delusions of the senses and defects of speech; and in 11, shifting pains in various parts. These symptoms are deceptive; many of them will be often experienced after the worm has been completely expelled; and even viewed in connection with the patient's habits, occupations, and residence in a locality in which the *Cestoidea* are known to be prevalent, are not of themselves diagnostic of the existence of tape worm. It is only by the discharge of segments of the worm, that the nature of the disease can be satisfactorily recognised. The passage of the segments *per anum*, either with the fæces, especially when there is diarrhœa, or without this accompaniment, is the most frequent. The discharge of them by the mouth is extremely rare, and can occur only when there is violent vomiting, and when there is dangerous obstruction of the bowels. The passage of them through the intestines into the peritoneal cavity, or into the urinary bladder, or through fistulæ opening on the surface of the body, can occur only when ulceration of the intestines has been followed by perforation and a fistulous com-

globosa; testa laevi simplici (?) instructa  $\frac{1}{10}$ " magna. Longitudo totalis 6—10". Patria Ægyptus, in hominis intestino tenui semel reperta numero permagno."  
—KÜCHENMEISTER.

munication in either of these directions, or after wounds penetrating into the bowels. These several ways by which segments of tape worm were passed externally were known to the older writers, and were ascribed by them to the mechanical or perforating action of the worm. But it is singular, that, whenever ulceration and perforation of the bowels occur coincidentally with the presence of worms, an instinctive desire of the latter to escape from the bowel, through either the morbid opening or the natural passages, is observed.

74. v. IMMATURE *Tænia* FOUND IN THE HUMAN BODY EXTERNALLY TO, BUT NOT WITHIN, THE INTESTINES.—These form the *Cysticæ* and *ACEPHALOCYSTIDES* of older writers. The *CYSTICERCUS CELLULOSE*, being identical with *Tænia solium*, has been noticed when treating of that tape worm (§ 62, et seq.). I shall only briefly notice the other Immature *Tæniæ* occasionally found in the human body externally to the intestines.

75. A. *CYSTICERCUS TENUICOLLIS* (ESCHRICHT), *CYSTICERCUS VISCERALIS* (AUCL.).—As the mature *Tænia*, of this cystic worm is not found in man, but chiefly in the dog and wolf (*Tænia marginata*), I shall not occupy any part of my limited space by describing it, but refer the reader to Dr. LANKESTER's translation of KÜCHENMEISTER's work (p. 178.).

76. (a.) The *Scolex* or immature state\* of this *Tænia*, however, being sometimes formed in man, especially in former times, requires a brief notice at this place; it forms the *Cysticercus tenuicollis* of recent writers, and the *C. visceralis hominis* of earlier authors. The rarity of this scolex in human subjects in modern times has induced VINCOW and DIESING to doubt its occurrence, whilst ESCHRICHT has proved its rare appearance in man, especially in the liver.

77. (b.) The structure of this Cystic worm is rendered remarkable by its frequently enormous caudal vesicle, which in animals may attain the size of a child's head, by the concentric wrinkles or rings, visible externally, which pass round the worm, and which are crossed by very fine longitudinal striæ, so that, when it is laid upon a plate, and held on the same plane with the eye, the animal has a finely chequered appearance. In the dead *Cysticercus tenuicollis*, incrustated with calcareous matter, these concentric rings may be recognised, and the calcareous deposit often forms a plaster-like cast of the form and structure of the cystic worm. The parietes, also, when a transverse section of the dead *Cysticercus* is made, present a structure consisting of concentric strata, analogous to that of the *Echinococci*. Here, however, it is so extremely fine and delicate, that there is great trouble in detecting it.

78. B. *ECHINOCOCCI*.—Some naturalists admit only of one species or variety of *Echinococcus*, others of two, and others of even a greater number. VON SIEBOLD divides this species into

\* " Scolex quiescens = *Cysticercus tenuicollis*. — Vesicâ caudali tenui permagnâ (1, 2, 4, 6" et ultra); Corpore 14—30 millim. et ultra longo, 5—10 millim. lato, cylindrico; Collo 8—15 millim. longo; Capite uti in *Tænia* filis 2 gelatinosis, pone collo ex receptaculo capitis aut scolecis in vesicâ cavitatem emissis. Metamorphosis in *Tæniam* 10—12 hebdomadis post partum peracta.

Habitat. Rarius in hominis abdomine (mesenterio et hepate), sæpius in Ruminantium, Equi, Suis Scrofe Scervi, Simiæ, &c., cavitatem abdominali. — KÜCHENMEISTER.

*E. hominis* and *E. veterinorum*; but, from the accounts of various writers, both varieties have been found in the human subject.

79. 1st Var. *ECHINOCOCCUS SCOLICIPARIENS*\* — *Echinococcus veterinorum*, of authors.

SYNON. — *Tænia visceralis granulosa*, GÖZE; *T. granulosa*, GMEIN; *Vesicaria granulosa*, SCHRANK; *Hydatid erraticum*, BLUMENBACH; *Polycephalus hominis*, GÖZE; *Pol. granulosa*, ZEDER; *Pol. Echinococcus*, ZEDER; *Echinococcus veterinorum*, RUDOLPHI; *Echin. giraffe*, GÉRAIS; *Echin. simia*, RUDOLPHI, alique; *Echin. granulosa*, RUDOLPHI; *Echin. infusorius*, LEUCKART; *Echin. polymorphus*, DIESING; *Echin. scolicipariens*, KÜCHENMEISTER.

80. (a.) The mature *Tænia* has hitherto not been found in the human subject. VON SIEBOLD in 1852, and KÜCHENMEISTER in 1854, bred this *Tænia* by giving *Echinococci* to dogs. The description in the subjoined definition gives all that is required to be known of it; but the eggs and six-hooked embryos must occur at some period in the human intestines, in the water and raw articles of diet, especially vegetables, fruits, roots, &c. Like the embryos of other *Tænia*, however, they escape the human eye. "Their migration is certainly performed, like that of the embryos of other *Tæniæ*, by their perforating the intestine and getting into the abdominal cavity, where they prefer attaching themselves to the liver or the kidneys, or to the organs in the thoracic cavity. A portion of them, however, may migrate along the *ductus choledochus* to the outer surface of the liver." They take up their position in the same way as the other *Cestoides*, the envelopes formed around them being similar, but much thicker.

81. (b.) The *Scolex* forms a vesicle which, according to ESCHRICHT, measures 2½—3 inches, and is firmly attached to the organ in which it dwells. The enveloping cyst is like others, but more concealed and more abundantly permeated by proteinous unorganised substances, by which its walls are thickened. It may be partly separated into layers, the inner being smooth, like a serous surface. A second vesicular body fits exactly to the inner surface of the innermost layer of this enveloping cyst, and is the true cystic worm, the so-called mother vesicle of the *Echinococci*, that is, the six-hooked embryo, which, continually increasing, has attained an extraordinary size. It is almost impossible to get the cystic worm uninjured out of its cyst, to which it ad-

\* *Tænia matura*. — *Tænia minima*, ad 3 millim. longo, corpore 3-aut 4-articulato. Capite subgloboso, 0·3 millim. lato; rostellum parvulo, rotundato, 0·125 mill. longo; oculis suctoribus magnis 0·13 mill.; hamulis in duplo ordine positâs 28—36, quarum majores ex Leuckart's mensura 0·045, minores 0·038, ex metâ mensuris 0·034 et 0·028 habent. Habitat. Interdum in homine, plerumque in aliis animalibus plerumque domesticis ex ordine ruminantium et herbivororum. — KÜCHENMEISTER in Op. est. p. 192, 3.

heres so firmly. The walls of this worm are elastic, and tremble like jelly, when touched, even after they are empty. They never collapse altogether as seen in *Cysticerci*, nor lie, like these, even when dead, at the bottom of the envelope-cyst. Their cut margins roll themselves up, and present a gaping appearance. The transverse section of this cystic worm shows a structure of more or less numerous consecutive circular strata, varying according to age.

82. *c.* The structure of this cestode has been described by ESCHRICHT, VON SIEBOLD, and others, who say that its parietes consist of two similar membranes, loosely connected, the outer being firm and cartilaginous, and the inner thin and smooth, resembling a mucous surface, which is beset with small elevations of a size up to  $\frac{1}{4}$ ''', which are partly very young scolices, in the act of development, partly further developed scolices of  $\frac{1}{4}$ ''', and partly the points on which such scolices formerly sat. In the fluid contained in these vesicles there are also free scolices, part of which are still furnished with the remains of the stalk. For other minutæ of structure I must refer the reader to Dr. LANKESTER'S translation of KÜCHENMEISTER'S work.

83. This cestode worm is found chiefly in the liver of man and ruminating animals. It has been detected also between the choroid coat and the retina of the human subject. When present in the liver, this organ is generally swollen, especially posteriorly, pale, or of an uniform greyish-brown colour. Its surface presents larger or smaller spots of a whitish-yellow colour, of a regular form, and very slightly raised. This species is generally seated so deeply as hardly to project above the level of the surface of the organ, unless it is very largely developed.

84. *d.* The symptoms caused by this *Echinococcus* are usually slight, limited, and equivocal. The vesicles seldom exceed the size of a walnut or hen's egg. Even when they are present in numbers, their diagnosis is most difficult. When they are small or few, the disturbance of the functions of the liver may be slight. When more numerous or more fully developed, there are generally pain and uneasiness in the hepatic regions; with increased pain on pressure and percussion; the dull sound on percussion being more extensively heard, and the liver being often felt from one to two inches below the false ribs. There is also irregularity of the bowels, the evacuations being unhealthy, and often deficient in bile. Jaundice is sometimes observed. But all these symptoms may be caused by other lesions of the liver.

85. *B. ECHINOCOCCUS ALTRICIPARIENS.* *Echin. hominis, Auctorum.*

86. KÜCHENMEISTER\* believes that this species

has been confounded with the preceding.—*a.* Its mature *Tania* is unknown. Nevertheless, he thinks that it probably occurs in the human intestines, and indeed in the intestines of those individuals who suffer, or have suffered, from the species of *Echinococcus* belonging to it in some part of their bodies, and in whom such a colony of *Echinococci* has opened towards the intestine. This *Tania* may also develop itself in the intestines of domestic carnivorous animals. That the eggs and embryos must occur at some time or other in the human body must be admitted, although they escape observation from their small size.

87. *b.* The *Scolex*—the *Echinococcus altricipariens*—occurs not only in man, but also in the larger domestic animals, especially Herbivora. It is very prevalent in Iceland. Dr. SCHLEISSNER states that he saw fifty-seven human patients suffering from *Echinococcus* in that island; that it occurred more frequently inland than on the coast; and that it constituted one-eighth of the diseases of the place. Dr. THORSTENSON of that island says, that every seventh living human being in it suffers from *Echinococci*; that females are more liable to them than males, and that their abundance increases with age, men being most frequently attacked by them between their thirtieth and fortieth, and women between their fortieth and fiftieth years.

88. *c.* The characteristics of this species of *Echinococcus*, as distinguished from the preceding, appear to be as follows:—(*a.*) The enveloping cyst, and the mode of annexation of the inner wall of this cyst to the primary vesicle of the *Echinococcus* derived from the six-hooked embryo, are similar in this and the foregoing species; but the cyst formed by *Echin. altricipariens* is much larger than that of *Echin. scolicipariens*, and hence projects far above the level of the organ in which the colony exists.—(*b.*) Owing to its much greater bulk a proportionately increased interference with the functions of the organ results, and eventually with the whole organism.—(*c.*) As regards the animal itself, we find not only single scolices or a single vesicle in such a colony, but the constant production of fresh vesicles with young (daughter- and granddaughter-vesicles), sometimes with, and sometimes without, the production of separate scolices adhering directly to the walls of the vesicle. According to THORSTENSON and SCHLEISSNER, the hydatids occurring in Iceland exhibit this structure. "The hydatid sacs," they state, "are formed not only in the human liver, but also in many parts of the abdomen, and are often of enormous size. Hundreds of hydatids are frequently evacuated through the external opening of the sac, or with the stools, and in vomiting. They do not, however, occur only in the interior of the body, but also very frequently in the skin, where they appear like large saccular swellings. The course of the disorder is very chronic." KÜCHENMEISTER states that the vesicles produced do not, like the original mother-vesicle, bear six embryonal hooklets, as they never have occasion for them. The six hooklets may be sought for in vain, even in the mother-vesicle, as, although certainly present, they must, from their extreme minuteness, escape detection on such a large

mesticis, et quidem in diversissimis et hominis et illorum animalium corporis regionibus. Ovula, hucusque ignota."

\* He gives the following definition of its *Scolex*:—  
"Vesica animata Echinococco scolicipariens similis sed omnino eo multo major (ad  $\frac{1}{2}$  ped. in diamet.). Scolices singuli quiescentes majore hamulorum minorum numero (46. 52 et ultra) armati parantur, aut ex modo Ech. scolicipariens, aut in geminis aut caputulis a vesicæ matris superspicie interna solutis in quibus licetum scolices et vesicæ secundariæ scolices gignendi si præditæ gignantur (mother-, daughter-, and granddaughter-vesicles); aut fortasse in vesicis, quæ divisione quadam aut sectione ex vesicæ matris in vasibus animalis hospitis repente et serpente formantur. Vesica mater nihil aliud est nisi vesicula embryonalis 6 hamulis armata, et valde ampliflata; vesicula filia et neptis hamulis 6 destituta, gula ex vesicula embryonali recta viâ non exorte sunt.

"Habitat. Non solum in homine, sed etiam, auctoribus Homberto et Creplino, in mammalibus majoribus do-

vesicle. The smallest of the granddaughter-vesicles are but just visible, and enclose four, five, or more scolices, which adhere peripherally, by a small stalk, to the inner wall of the common cyst, but converge with thin free ends towards the centre of the cavity of the small vesicle. In very large daughter-vesicles scolices also swim about freely. — (d.) The scolices produced or nursed by the mother-, daughter-, or granddaughter-vesicles, are in general more slender than those of the preceding species: they have the head with the double circlet of hooks, more frequently protruded during life, at least within the larger daughter-vesicles, exhibit distinctly marked sucking-discs, and bear a greater number (46—54) of hooks, which appear more slender than in the preceding species. — (e.) The dwelling places of this species are not limited. They may occur in the liver, the lungs, the kidneys, the sheaths of the testicles, the spleen, the ovaries, the breasts, the throat, in the sub-cutaneous tissues, in the bones, &c. — (f.) With the increase of the secondary and tertiary cysts in the mother-cyst, the swelling advances; and the more rapidly this takes place, the recognition of the malady and its natural cure are facilitated; inasmuch as the mother-cyst is often burst by the distension, and probably in many cases becomes destroyed. Sometimes, however, the burst colony appears to heal and to recommence the production of fresh daughter-vesicles.

89. d. The prognosis of this species is more unfavourable than that of the preceding, "although the diagnosis is easier, on account of the more rapid growth and greater bulk of the swelling, the occurrence of the hydatid-buzzing, and the more distinct sensation of fluctuation. The structure of the walls of the mother-vesicle is the same in both species, and is characterised by the numerous parallel concentric layers in the substance of the walls, which appear more distinctly marked in the daughter-vesicles, and make their appearance with remarkable clearness after treatment with caustic potash, with the addition of a drop of red ink." (LANKESTER'S *Transl. of KÜCHENMEISTER*, &c.)

90. e. The Diagnosis of *Echin. altricpariens*. — The symptoms produced by a colony of these parasites vary with the organ in which it is located, and with the size and pressure of the tumour it develops. At an early stage of their growth these animals generally occasion little inconvenience, and when largely increased in bulk, they produce phenomena which vary little from those occasioned by tumours of the same size, in similar situations. Their superficial or deep-seated positions, and their vicinity to, and pressure upon, nerves and blood-vessels, will also modify effects, or even indicate their existence. But it is comparatively rare to obtain certain evidence of the presence of a colony of *Echinococcus* in the body, unless the passage of the gelatinous vesicles already described from the cavities after the bursting of such a colony, or from the punctures or incisions made into tumours. At the same time, the little scolices of the *Echinococcus* must be found in the vesicles, part of these retaining, others wanting their hooks, their sucking-discs being often indistinct. When the vesicles passed have an opening, the little scolices slip out very easily, and if the structures just mentioned be not found, it is doubtful whether or no a sterile colony or an acephalocyst be present.

91. Before perforation or bursting of the cyst

has occurred, the tumour produced by it being very considerable, an examination of it should be made by palpation and percussion, and if there be an obscure or sensible fluctuation, and when aneurismal symptoms are wanting, and when the general health is either good, or not injured to the extent that might be expected from the size of the tumour, if it were of a malignant nature, then an explorative puncture should be made to complete the diagnosis, and the evacuated fluid examined by the microscope in order to ascertain the presence of *Echinococcus scolices*, or of albuminous gelatinous shreds of *Echinococci*. By these means only can the nature of a cystic or sacculated, fluctuating or elastic tumour be determined, and the existence of these parasites ascertained.\*

92. Without these proofs the diagnosis can never be brought beyond one of probability. A sacculated or cystic swelling filled with fluid can alone be inferred. The most useful objective symptoms are the existence of such a tumour, which is elastic to the touch, and of a peculiar consistency

\* ACEPHALOCYSTS. — LAENNEC in 1804 viewed these structures as independent animal organisms. VON SIBOLD and KÜCHENMEISTER more recently opposed this view; and very lately, the last of these writers, in consequence of his experiments with the eggs of *Tænia*, considered that *Acephalocysts* are six-hooked cestode embryos, the growth of which has proceeded without hindrance, but which nevertheless have remained barren; or, more correctly, which have never attained to proliferation and the production of scolices." If *Acephalocysts* occur where normally developed *Echinococci* usually have their abode, they cannot be called strayed cestode embryos, but only *cestode embryos which have been disturbed in their normal development and remained barren*. KÜCHENMEISTER considers the following to be the characteristic marks of *Acephalocysts*:—1st. A fascicle adhering to the inner walls of a larger cyst from which it is capable of being detached, or is already detached, in particular spots, but never all over, and collapsed in wrinkles, and which presents very sparing calcification in its white, and scarcely discoloured walls. — 2nd. The transverse section exhibits walls consisting of distinctly developed, parallel, concentric layers. — 3rd. The walls have a peculiar, elastic gelatinous trembling. — 4th. The contents consist of a watery fluid, or of a substance of a purulent consistence, and contains the microscopic elements of calcifying encysted proteine masses in the act of resorption. — 5th. The vesicle sometimes conceals, in its interior, secondary cysts, with gelatinous walls, in which, however, we seek in vain for scolices of cestodea or their remains, especially their hooks. "The *Acephalocysts* which are referred to here belong to the following three species of *Tænia*:—1. *Acephalocysts* derived from *Tænia Echinococcus scolicipariens*. Many of those *acephalocysts* which bear no daughter-vesicles in their interior, must be referred to this species. 2. *Acephalocysts* derived from *Tænia Echin. altricpariens*. These are *acephalocysts* with a formation of daughter-vesicles. 3. *Acephalocysts* derived from *Tænia ex Cysticercus tenuicollis*." KÜCHENMEISTER remarks respecting these last that what ESCHREICHT regarded as possible, has since proved to be the case; for that in one administration of eggs of *T. ex Cyst. tenuicollis* to a lamb, he found a sterile *Cysticercus tenuicollis* in the midst of other equal-sized and fully developed *Cysticerci* of this species. This sterile individual bore perfectly distinct indications of life. All structures, he adds, which are really *acephalocysts*, and which are living sterile specimens of *Cysticerci* and *Cæneri*, are distinguished from those derived from *Echinococci* in that the walls of the latter consist of very distinct concentric layers, tremble like jelly, and are extraordinarily elastic; whilst the walls of the analogous structures derived from *Cysticerci* are considerably thinner, have not the elastic consistence of jelly, and consist of such fine and delicate concentric layers as hardly admit of detection. Such being the origin and nature of *Acephalocysts*, it is obvious that the phenomena produced by them cannot be materially different from those caused by the two species of *Echinococcus*.

The subject of *Acephalocysts* has been already treated of under the article HYDATIDS; but instead of viewing them as in that article, as independent organisms, the more recent Continental microscopists and experimenters have shown them to originate as now stated.

and form, in places where swellings do not usually occur; but, when those do make their appearance, they are generally *Echinococci*. The highest degree of probability that an unopened tumour belongs to a colony of *Echinococci* is attained when the swelling occurs in places such as the liver, spleen, kidneys, lungs, breast, testicles, throat, &c., where *Echinococci* are otherwise brought to light, either artificially or naturally. On percussion, the finger, placed over the swelling, often feels a trembling or oscillation of the mass underneath it, especially when several gelatinous tremulous cysts are inclosed within a larger vesicle; these being set in motion by the percussion appear to produce this trembling or oscillation, which however frequently is not felt.

93. *f. The Etiology of the Echinococci* is manifestly the ingestion of one or more of the eggs or six-hooked embryos of the *Tenia Echinococcus altricarpans*, at some time of the life of the patient. The mode of life of persons in some localities, and in some circumstances, may be favourable to the passage of the eggs of this *Tenia* into the stomach; and it is now well understood that certain *Cestodea* often have a very limited habitat. "The duration of the life of the *Echinococcus* does not appear to be very short. According to ESCHRICHT, one patient must have borne his colony eighteen years."

94. *g. The Prognosis of the Echinococci* varies according to the organ in which they are seated, to their situation in that organ, and to the primary and consecutive injuries caused by them to the organ and to the whole system. But the prognosis is upon the whole more favourable than is generally supposed, especially when the general health and the powers of vital existence are duly promoted. "The tumours, when they are accessible, are amongst the number of curable tumours; they may cure themselves by bursting, and when they are once got rid of, relapses in the same colony are rare and exceptional cases, and every *Echinococcus* produced usually owes its existence to a new immigration of embryos. But for this very reason the continuance of the mode of life in endemically affected places furnishes a more unfavourable prognosis. The natural cure by the bursting of the colony, and the passage of daughter-vesicles may be accompanied by symptoms dangerous to life, or if it take place in the direction of the larger bronchi, by difficulty of breathing, or may even lead to actual suffocation." (*Op. cit.* pp. 227, 228.)

95. *B. Sub-order, TREMATOIDEA*—*SYNON.*—*Myelmintha*, DIESING; *Egelwürmer*; *Platyelmintha isolata*, isolated flat-worms, KÜCHENMEISTER.

*DEFINIT.*—"Animalia solitaria, plerumque hermaphroditica, rarissime sexu distincto, et poris plerumque suctoriis, medianis aut lateralis instructa. Canalis cibarius furcatim divinus aut ramosus, rarissime simplex. Evolutio fit plerumque metamorphosi et sapissime generatione alternante, rarissime sine illis."—LEUCKART.

96. This sub-order is divided by KÜCHENMEISTER into two Families, the *Monostoma* and the *Distoma*.

97. (a.) *MONOSTOMA*.<sup>\*</sup>—*SYNON.* *Cueullanus*;

<sup>\*</sup> "Corpus depressum vel teretiusculum. Caput continuum, vel collo discretum. Os terminale vel anticum, ut plurimum acetabuliforme, integrum, crenulatum, inerme vel armatum. Apertura genitalium perclara, duplex; mascula infra os, interdum acetabuliformis, pene

*Festucaria*; *Fasciola*; *Amphistoma*; *Distoma*; *Monostoma*; *Monostomum*.—It is very doubtful whether or no any species of *Monostoma* has been found in the human body. Professor JÜNGREN was said to have found eight *Monostoma* in an incipient cataract; and hence Von NORMANN named the species *Monostomum lentis*.

98. (b.) *DISTOMA*.<sup>\*</sup> (KÜCHENMEISTER):—*Distomum* (DIESING).—a. *Distoma hepaticum* †—*Distomum hepaticum*.—The fully developed *Distomum hepaticum* has been minutely described by KÜCHENMEISTER, but I must refer the reader for his description to his work, or to its excellent translation by Dr. LANKESTER.—a. I may, however, briefly state that its *skin* and *parenchyma* consist of muscular layers—of longitudinal, transverse, fusiform, and short fibres; that its organs of sense are wanting, and its nervous system has not been described; that its alimentary apparatus presents a mouth, pharynx, and excretory organ; that its female sexual organs lie towards the ventral surface of the animal, and consist of a germ-stock, with its efferent duct, two vitellines, a short oviduct, a sac-like uterus, and a vagina; that its male sexual organs consist of testicles, a ductus spermaticus, a vesica seminalis, and a penis; and that "the *Distoma* are hermaphrodites, with the following sexual actions: self-impregnation with and without copulation, and impregnation and

protractili; feminea pone masculum, minima, ut plurimum inconspicua. Porus excretorius supra caudae apicem antico margine caudali. Animalia manulatum, avium, amphibiorum et piscium corpora, i. e. præter tractum intestinale organa varia inhabitantia, libere aut folliculis inclusa." (DIESING.) Metamorphosis et generatio alternans inter evolutionem, uti in *Distomis*. The ventral sucker is therefore deficient, and DIESING gives a warning, "Cave, ne *Bothriocephalidium articulum solitarium* pro '*Monostomum*' habeas, aut porum genitalem, interdum callosum, cum acetabulo confundas."

<sup>\*</sup> "Corpus depressum vel teretiusculum, armatum vel inerme. Caput continuum, vel collo discretum. Os terminale, vel anticum, ut plurimum acetabuliforme. Acetabulum unicum ventrale sessile, vel pedicellatum, medianum, ab extremitate postica plus minusve remotum. Aperturæ genitales approximatae, sapissime ad eorum conjuncta (clauda instructa), supra vel infra acetabulum sitæ. Animalia plerumque hermaphroditica, rarissime sexu distincta. Ovula embryones parentibus rarissime similes, plerumque distinctius aut fibrillosi, aut fibrillis destitutos continentia, quare evolutio fit metamorphosi et generatione alternante.

"Statu immaturo aut libere in natura vagantia, aut in organorum parenchymate, imprimis in animalibus inferioribus inclusa. Statu maturo entoparasita animalium præcipuis vertebratorum, aut libere in variis organis et cavitatibus aperitis et clausis viventia, aut in folliculis inclusa."—DUJARDIN et DIESING.

† "Corpus planum, armatum, saltem in juvenili, ætate magis profectâ adhuc in collo. Individua juniora 4''=9 mill. longa, 1½''=3.3 mill. lata; adulta 8-14''=18-31 mill. longa, 3½-6''=8-13½ mill. lata.

"Collum subconicum, breve. Os hauri nodulosum, terminante triangulare, 1/4 mill. latum. Acetabulum 1.5 mill. latum, ore majus asperum ad colli basin, aperturâ triangulari, 3-4 mill. pone os situm.

"Orificia genitalia fere contigua, mediâ in parte inter os et acetabulum sita. Penis cylindricus, 3 mill. longus, 0.5 mill. latus, falciformis, prothincus, tincinulis parvulis armatus. Testiculi maximâ ex parte mediâ in corporis posterioris parte sitæ, ex trunco mediano et ramificationibus, ad finem cæcis, compositi. Organa vitellina ad latera animalis sita, inter se horizontalia quodam et transversa ramo conjuncta et statim in uterum simplicem magnitudine crescentem, multivarie volutum transcuntia. Ovula flava, nitra quadam parvula aut oblongo, dehiscentia, 0.056-0.063'' (V. et Par.)=0.126-0.144 mill. longa, et 0.035-0.038''=0.079-0.086 mill. lata.

"Embryones Cercariarum utriculi aut *Rediæ*, nec minus Cercariæ liberae, si omnino hæc forma præbetur, ignota. Migrationum modus nondum cognitus. *Distomum* juvenile immaturum sæpius sub cuticâ laminaâ inventum."—KÜCHENMEISTER.

copulation with a second individual." This *distoma* occasions great devastation in the livers of herbivorous and domestic animals, especially in wet seasons; but it very rarely occurs in man.

99. *b. Diagnosis.* — *Distoma* in the liver causes dilatation and inflammation of the gall-ducts, and destruction by pressure and disappearance of large portions of the parenchyma of the liver in the vicinity of the enlarged ducts. These changes, however, cannot always be recognised, or referred to their true source in the human subject, as several lesions of the biliary organs and apparatus occasion the same symptoms as they produce. The *distoma* may even cause many of the phenomena of gall-stones passing along the ducts, with or without more or less of jaundice; but these cannot assist in establishing a diagnosis, the passage only of the animals with the faeces or with the matters vomited being the only proof of their presence in the human subject.

100. *c.* It is obvious that no prognosis of the *Distoma* malady can be formed unless the animal be discharged and recognised. When this takes place, although the prognosis is upon the whole unfavourable, yet there may not be any immediate danger. The life of the patient may be prolonged or even a recovery ultimately obtained, by promoting the secretions and excretions by suitable means, and by supporting vital force and resistance.

101. *B. Distoma lanceolatum*\* (MEHLIS). This species was seen in the human subject by BOCHOLZ, CHABERT, and MEHLIS. It is narrow and elongated, and distinguished by its long neck, by the want of any spinous coat, and by the female organs especially occupying the abdomen, and the testicles the anterior part of the body. SCHAEFFER, RUDOLPHI, and MEHLIS established this as a distinct species of *Distoma*, and showed that GOEZE, ZEDER, BREMER, were wrong in regard to it as a young *Distoma hepaticum*. It is stated by KÜCHENMEISTER to be less injurious to the structure of the biliary apparatus than the *D. hepaticum*. The diagnosis is possible only when it passes off. The prognosis is probably more favourable than in the case of the other parasite.

102. *γ. Distomum heterophysis*† (VON SIEBOLD). — This parasite has hitherto been found only in two

instances, but in very great numbers, in the small intestines, by BILHARZ. Its influence on the animal economy is unknown. It is unnecessary to give a further description of it than that contained in the subjoined definition.

103. *δ. Distomum hæmatobium*\* (BILHARZ). — *a.* This parasite was first found in 1851, in the blood of the portal vein. It appeared as a white elongated entozoon, resembling a nematoid worm when examined with the naked eye; but was found to be *Distomum*, with a flat body and a cylindrical tail ten times as long as the body. This tail was no loosely attached, deciduous portion of the body, as in the *Cercaria*, but a continuation of the body of the worm itself, which was flat and rolled towards the ventral surface. This first animal found was clearly recognised as the male; another subsequently found in one of the mesenteric veins of the same subject was ascertained to be the female. For a minute description of the sexual organs, eggs, and development of this animal, I must refer the reader to KÜCHENMEISTER'S work. It may, however, be stated that, according to Professor GRIESINGER, this parasite is so extraordinarily abundant in Egypt as to have been found 117 times in 363 dissections. It would appear that the *Distoma* get into the blood-vessels and lay their eggs, which at last escape from the ruptured vessels in the intestinal and urinary mucous surfaces. Dr. REINHARD saw, hanging out of a vessel accidentally opened by KÜCHENMEISTER, one of these *Distoma*, which bore his female with him. The action of their eggs and embryos on the mucous coat of the intestines and urinary organs, and on the biliary apparatus, is of a very dangerous nature.

104. *b.* In the intestines are found deposits on and beneath the mucous membrane, verrucose

viter convexum. *Acetabulum oris subapiciale, infundibuliforme, parvum. Acetabulum ventrale parvulum aut medium situm, magnum (acetabulum oris dicitur et ultra superans), globosum. Pharynx muscularis, globosa; canalis cibarius ante acetabulum ventrale in 3 partes cæcas divisis. Cirrus post acetabulum ventrale situs, et oblique cum sinistra (sua parte coelitus, globosus, acetabuliformis, circulo incompleto setarum 73 minutissimarum, ramulis 5 secundis instructorum coronatus, testiculis organoque germifero globosis. Longitudine  $\frac{1}{2}$ — $\frac{1}{4}$ " ; latit.  $\frac{1}{4}$ ".*

\* *Patria. Aegyptus; in hominis intestina tenui hic repertum, numero permagno.* — KÜCHENMEISTER.

\* *Descriptio vermis secundum BILHARZ.* " *Distomum hæmatobium, sexu distincto. Maris corpus molle, albidum, filiforme, parte anteriore totius longitudinis octava vel nona ('truncus') depressa, lanceolata, subius plana vel concava, supra leviter convexa, superficie lateri, reliqua corporis parte ('cauda') tereti, marginis corporis ab acetabulo ventrali retro utrinque versus faciem ventralis conflexo, eoque modo canalium 'gynaecophorum' efficiente, apice postico, attenuato, superficie externa tuberculis piligeris conferta, superficie canalis posteriore linea mediana lateri et partibus lateralibus oculis minutissimis scabra. Acetabulum oris apiciale subinflexum, triangulare. Acetabulum ventrale sub flavo 'trunci' insertum, orbiculare eadem magnitudine cum acetabulo oris. Superficies utrinque acetabuli granulis cæcis minutissimis scabra. Canalis cibarius sine pharynge musculari ante acetabulum ventrale in 2 partes divisis, in posteriore 'cauda' parte densius unitus, cæcus. Ferrus genitalis inter acetabulum ventrale et canalium 'gynaecophori' originem situs.*

" *Femina forma distans, tenerior, gracillior; corpus tenuiforme, leve, hyalinum, antice sensum valde attenuatum, cauda canali nullo apice angustata. Acetabula et canalis cibarius, ut in mare. Ferrus genitalis cum margine posteriore acetabuli ventralis coelitus.*

" *Longit. 3—4 lin.; mas feminam latitudine vultu superans.*

" *Patria. Aegyptus; in hominis vena portarum etque ramificationibus et in vena uterica parvibus. In vena mesenterica reperitur marca fontium in canali gynaecophora gerentes, in vena intestinalibus et hepaticis, in vena lienali sæpepe vidui.*"

\* *Corpus leve, lanceolatum, planum, aliquid pellucidum, aut ovulis flavofuscum, 4.5—12 millim. seu 2—6" longum, 2 ad 2.2 millim. aut 1—2" latum in anteriore parte tenuius, acetabulo finitum, in posteriore aliquid obtusum. Collum continuum, concavum, planum, longius quam in *D. hepatico*. Os fere terminale, globosum, 0.48 mill. latum, acetabulum orbiculare, 0.48 mill. latum, 1.1 mill. pone os situm, ore magis. Oesophagus 0.48 mill. longus, bulbis œsophagi 0.10 mill. latus; intestinum bifurcatum, rectum, simplex, non amplius ramificatum, 0.04 mill. latum.*

" *Genitalia inter os et acetabulum ventrale esse aperientia, inter intestinali bifurcationem sita. Vesica seminalis exterior = cirrus claviformis; funiculus spermaticus flexuosus; penis longus, cylindricus, plerumque rectus; testiculi 2 majores et tertius minor vesicam seminalem internam exhibens; vasa pone alterum et pone acetabulum ventrale siti, vis lobati. Organa vitellina multa minor, quam in *D. hepatico*, albidia, lateralia, ramificata, 1—1.1 mill. longa, in ovarium et uterum intrantia, longiora quam in *Dist. hepatico* et tenuiora, sed colore obscuriore prædita, multifarie rotata. Ovulo multo minor, quam in *Dist. hepatico*, 0.041 mill. = 0.018" Par. 0.0185" Vienna longa, et 0.0246 mill. = 0.0108" Par. 0.011" Vienna lata, sed in statu maturo multo obscuriora quam in *D. hepatico*, et nigro-rubra.*

" *Systema excretorium: Vasa lateralia, ad collum usque prominètia, ibique recurrentia et intumescèntia minora, ad animalis apicem sita, finita.*" — KÜCHENMEISTER.

† *Descriptio. "Dist. heter., hermaphroditum. — Corpus ovato-oblongum, depressum, subtus planum, supra le-*

and lobate fungous excrescences, and also the aggregations of the eggs in the vessels of this membrane, "where the eggs are often fixed in rows in the mucous and sub-mucous tissues, in and beneath the croupous exudations upon the intestinal ulcers; and, lastly, after the rupture of the vessels upon the free surface of the mucous membrane."

105. *c. Action on the Liver.*—"The entire trunk of the portal vein is sometimes filled with mature animals, with eggs in the substance of the liver; and it is not impossible that the *Distoma* situated in these places may give rise to a tough, dry, anæmatus consistence of the liver, or perhaps even to abscesses."

106. *d. The alterations in the urinary bladder produced by Distoma hæmatobium* are at first circumscribed spots of hyperæmia, with bloody extravasation and swelling of the mucous membrane, or tenacious mucus, with greyish-yellow masses of exudation, in which the eggs are imbedded. "It is rare that the whole inner wall of the bladder is injected and ecchymosed. The urine is mucous, but pale and clear; and BILHARZ found eggs in the urine passed." In later stages, yellowish discoloured elevations, mixed with many pigment spots. These elevations often form a soft coat, sometimes a line in thickness, mixed with bloody extravasations, firmly attached to the mucous membrane. Sometimes calcareous incrustations of the egg-shells, the deposition of the salts of the urine, and the aggregation of eggs, give the whole a sandy texture. Very rarely this coating covers true ulcers with loss of substance. At other times, single or aggregated vegetations, varying from the size of a pea to that of a bean, of a yellowish colour or ecchymosed with blood, are found on the vesicle mucous surface. In the smooth-edged spaces of these vegetations, sitting in the sub-mucous tissue, formed by the diverticula of its vessels, and only constituting productions of the vessels, BILHARZ first found the *Distoma*, and in the mucus and exudation over these spots their eggs. We may conclude from this that the *Distoma* collect there, and in similar situations, to lay the eggs which are to be passed off.

107. *e. The mucous membrane of the ureters*, either alone or with that of the bladder, or even with that of the pelvis of the kidney, in rare cases, is attacked in a similar manner. A gravelly matter, in molecular masses of imbedded eggs of *Distoma*, either empty or containing embryos, with blood, exudation corpuscles, and crystals of uric acid, is sometimes passed in the urine. Individual embryos also occur free, but GRIESINGER found these in a dead state only. In consequence of the thickening of the inner coats of the ureters, complete or partial occlusion of these ducts with dilations above it, with retention of urine and its consequences, sometimes supervene. The kidneys are somewhat swollen and congested with blood, and the mucous membrane of the pelvis is much injected. The kidneys, in rare instances, ultimately degenerate in a fatty or suetty state. "The aggregation of eggs of the *Distoma* are not unfrequently the nuclei of deposits of gravel and stones, consisting chiefly of crystals of uric acid, in the kidneys, ureters and bladder, and thus give rise to the well-known consequences of stone and gravel. This is the *Lithiasis* of the Egyptians, described by PROSPER ALPINUS in "*Medicina Ægyptiorum*,"

108. The seasons appear to have some influence upon the frequent occurrence of this worm, as it has been observed to be more abundant from June to August, and more rare in September, October, and January. This difference is probably owing more to the kind and quality of the food in these months, than to temperature or season.

109. *f. The symptoms* of this parasite are manifested chiefly in the urinary apparatus, and in the urine itself, at an early period of the lesions produced by it. Causeless hæmaturia, especially if frequent, and attended by anæmia, emaciation, and disordered bowels, should be a cause of suspicion, especially in tropical countries. The diagnosis, however, during life, can be certain only when the eggs are found in the bloody urine and in other evacuations, as they were by BILHARZ.

110. *g. Distomum ophthalmobium* \* (DIESING).—This parasite was found in the eye of an infant, between the lens and the capsule, by GESCHIEDT. The infant was five months old, and was born with *cataracta lenticularis*, with partial suffusion of the capsule. Four specimens of this *Distoma* were found, and were recognisable by the naked eye.

ii. Order, NEMATELMIA — NEMATOIDEA. — Thread-worms, Round-worms.

111. The worms now to be treated of are the First Order of RUDOLPHI.—"*Nematoidæ: Corpus elongato, tereti, elastico.*" DIESING, in his "*Systema*," arranges them as the Sixth Order of his first sub-class, and defines them—"Nematoidæ: *Corpus elasticum, cavum, subcylindricum; tractus cibarius simplex; caput in proboscidem haud protractile. Endoparasitica, tandem rarius extus libere vagantia.*" They form the second order of KÜCHENMEISTER'S second sub-class, and he defines them as follows:—"NEMATELMIA: *Corpus teres, elasticum, sæpe attenuatum, filiforme; ore centrali, vel sub-centrali; canali cibarius aut distinctus aut obsoletus, anoque destitutus. Metamorphosis in paucissimis. Migrationes activæ aut passivæ in permultis.*"

112. *Mature Nematode Worms* are met with in the human subject in the cavities of the body, having mucous surfaces, in the sub-cutaneous cellular tissue, with an artificial external communication, and during their youth, and in an immature state, in various muscles, especially primitive muscular fasciculi. The division of this order of worms into numerous genera and species has been attempted by DUJARDIN, VON SIEBOLD, DIESING, and others, but without sufficient agreement to admit of further reference to it than is made by KÜCHENMEISTER, who does not adhere to a strict classification, but rather reviews them in accordance with their dwelling place in the human body, and selects for them the name most generally employed. It was formerly thought that the *Nematoidæ* were the most accurately known of *Entozoa*; but at the present day we have more positive knowledge of the history and development of the Cestode Worms, and even of the *Trematoda*, than of this, the order of Round worms.

113. "The distinct presence of a digestive

\* "*Corpus arato-lanceolatum, depressum, variabile. Collum breve subcylindricum. Os terminale orbiculare. Acetabulum ore majus, subcentrale, apertura orbiculare. Longitud.  $\frac{1}{4}$  lin.; latitud.  $\frac{1}{10}$  lin.*"—DIESING.

apparatus, divisible into mouth, œsophagus, stomach, intestine, and anus, the separation of the sexes into two individuals, the certain detection of a nervous system in some of them, and the apparently jointed structure of the round worms, bring them near to the Articulata. In the human subject we must take into consideration—1, the *Trichocephali* and *Trichinae*; 2, the *Oxyuri*; 3, the *Strongyli* and *Ancylostoma*; 4, the *Filaria*; and 5, the *Ascarides*." (*Op. cit.* p. 289.)

114. A great part of the Nematode worms appear to reach maturity only after they have undertaken various immigrations and emigrations during their youth. One species of round worm common to man is to some extent capable of migration also in the mature state. The migration in the early stage of development consists of the escape outwards of the eggs of these worms with the human fæces, with which they get into dung-hills, sewers, &c., and experience the transitions described above (§ 7, *et seq.*). My limits admit not of an account of the sexual and other organs of this order of worms, and of the various stages of their development; sufficient reference to these topics for practical purposes has already been made, and the reader may further peruse the minute descriptions of KÜCHENMEISTER and VON SIEROLD, and of other recent observers, to whom I have referred.

i. *TRICHOCEPHALUS*. \* — SYNON. *Trichuris*, ROEDERER; *Ascaris*, LINNÆUS; *Mastigodes*, ZEDER; *Trichocephalus*, GOEZE, DIEBING, DUJARDIN, &c.

115. 1st. *Trichocephalus dispar*†, with its progeny known as *Trichina spiralis*‡, OWEN and LUSCHKA.

SYNON. *Trichocephalus dispar*, GOEZE; *Tri-*

*churis*, ROEDERER and WAGLER; *Ascaris*, LINNÆUS; *Mastigodes*, ZEDER; *Trichina*, *Filaris*, Auct.; *Trichure*, Fr.

116. A. This worm was first discovered by MORGAGNI in the cæcum and vermiform appendage of typhous patients; and ROEDERER and WAGLER, in 1761, recognised it as a distinct worm, in the "morbus mucosus," or mucous fever, so prevalent in Germany in the middle of the eighteenth century. It was long supposed to exist only in the intestines of typhous patients, but it is now fully ascertained to have no particular relation to any disorder of the human bowels. It is found chiefly or only in the lowest region of the small intestine, near the ileocæcal valve, in the cæcum, and colon. From the dingy colour of the worm, it is liable to escape detection, and only is detected with ease when the lower intestines are free from their thick and coloured contents, as in disorders attended by diarrhoea. If carefully sought after, these worms will be found more frequently and in greater numbers than is commonly believed. RUDOLPHI found many hundreds in the situations just named. BELLINGHAM saw upwards of 100 in the cæcum only of one patient in Dublin. They occur in both children and adults, and in Europe and Africa. KÜCHENMEISTER's work and its translation by Dr. LANKESTER, contain very minute descriptions of the organization of this parasite. The subjoined systematic description is sufficient for all practical purposes.

117. B. *Trichina spiralis* (OWEN and LUSCHKA), as the brood of *Trichocephalus dispar*, engaged in migration.—This asexual worm was first described by OWEN in 1835, although previously seen by TRIEDMANN in 1822, and by HILTON and WORMALD in 1833. It was afterwards seen and described by PAGET, KNOX, and others. The seat of this worm is, as is well known, the muscles of voluntary motion, and indeed all the muscles excepting the heart and the sphincter ani, where it has not yet been found. In the places where capsules of *Trichina* are seated, fatty tissue is constantly inserted, chiefly at their anterior and posterior extremities; the fat being apparently deposited to fill up the space produced by the *Trichina* having penetrated between the muscular fibres.

118. a. The development of *Trichina spiralis* seems to be as follows:— "When a human being

lore magis fusca; extremitate caudali obtusa acuminata.

"Ovula fusca cum generis speciminibus; 0.054 mill. = 0.022" P. et V. longa; media in parte 0.025 mill. = 0.0112" P. et V. in apicibus 0.01 mill. = 0.0043" P. et V. lata. Embryonum migrationes adhuc ignotae. Fertilissimum est, *Trichinas*, quas diximus spirales, *Trichocephali disparis* embryones esse."

† Description of *Trichina spiralis*.—"Corpus plerumque in spiras 2 rectorum, ad anum verina crassius et obrotundatum, ad caput attenuatum; tubus intestinalis, uti apud *Trichoc. disparum*, ab initio multiformiter repletus, ventriculus pyriformis cum lateribus 2 appendicibus alosis (lobulis aut glandulis aut nervis), intestinum rectum post contractionem quandam iterum incrassatum, rectaque viâ ad anum in extremitate posteriori educto crassiore apertum profectum. Funiculus quilibet acuminatus in utraque extremitate cæcus et semithosaris gestationum primordia format (P.).

"Longit. vesicularum 0.2—0.5—0.7" P. = 0.4—1.0—1.5 mill.; latitudo fere mediam partem exhibet.

"Longitudo vemiculæ ex cystide liberati et vesiculis secundum LUSCHKA 1—1.5" P. = 0.037" F.; latitudo in capsula apice 0.008 mill. = 0.0037" P. et 0.0037" F.; latitudo extremitatis posterioris seu ani 0.024 mill. = 0.0109" P. = 0.111" F."—KÜCHENMEISTER.

\* Descript. Systemat.—"Corpus longissimum, ex 2 partibus formatum, quarum anterior tenuior, filiformis, posterior crassa, organa sexualia continens.

"Mas: tenuior quam femina; penis simplex; organon copulatorium auxillare spinosum, ex 3 branchiis compositum.

"Femina: mare major et crassior; vagina muscosa in abdomine scæe aperiens; uterus simplex; ovarium simplex. Animalia ovipara, via aut rarissime vivipara.

"Ovula oblonga, subfusca, in utraque extremitate collo quadam parvulo prominente ornata (in une sorte de goulot court, Dujardin)."—KÜCHENMEISTER.

† Systematic description of *Trichocephalus dispar*.—

"Cutis transversa striata, marginolæ rugas ad anum versus magnitudine adductas exhibens. Caput 0.02 mill. latum, retractile, obtuso-acuminatum, interdum perparvum papillâ instructum. Troctus intestinalis constituitur ex œsophago ad initio recto, angustissimo paulo post toruloso, scævum per totum collum intumescens; ventriculus pyriformis, ad latera sua glandulas 2 perparvas aut appendices alosis aut nervorum ganglia gerens. Animalia fecibus humanis pro nutrimento utentia. Mas: omnino colore clarior, fusco-albior; circiter 37 mill. longus (caput et collum 22; truncus aut abdomen 15); in trunco 0.5 mill.—1.0 mill. latus; fornam spiralem anans. Testis et funiculus spermaticus simplices ad intestini tenuis formam volutus; unâ cum tubo intestinali ante anum in cloacam committent apertus. Penis simplex; 3.35 mill. longus; 0.042 mill. ad extremitatem infundibuliformem, 0.027 mill. ad apicem verum latus; vagina Levi cylindrica instructa. Extremitas caudalis organo copulatorio auxillario, spinis ornato, subcylindrico ornata, cujus longitudo 0.451 mill. = 0.198" P. = 0.203" F., latitudo in parte libera 0.090 mill. = 0.039" P. = 0.040" F., in parte opposita fere 0.042 mill. = 0.0218" P. = 0.022" F. est. Cloaca communis musculo in maribus longitudo circiter 4 mill. = 2" P.; latitudo 0.261 mill. = 0.116" P. = 0.119" F.; latitudo foraminis cloacæ ipsius = (the lumen of the canal formed by the cloaca) 0.130 mill. = 0.058" P. = 0.059" F. Spermatozoïda globuliformia ad 50 mill. longa.

"Femina: in trunco rector, minus curva, mare aliquid latior, minusque elastica et flexibilis, ad ovulorum in utero et in ovaris copiam, eaque de causa co-

has swallowed the eggs, or the youngest brood developed into ready-formed embryos which occur in the eggs, or perhaps also when any female *Trichocephali* residing in the small intestine scatter their eggs with the ready-formed embryos in them, and when in either case the egg-shells are burst, and the embryos set free in the intestinal canal, the desire of migration awakens in them, and they set out, like the embryos of many other *Nematoda*, in the shortest and easiest way towards the tissues which they prefer as their resting place." That in this case, as in that of the *Cestodea*, the digestive canal may be the place of immigration from the exterior, is shown by the fact that the muscles of the tongue, pharynx, and œsophagus, as well as the sphincter ani internus, are visited by the *Trichinae*. In some cases the blood may be the bearer of the migrating brood. MEISSNER found the young attached to the inner walls of blood-vessels, and of the heart; and both he and LEUCKART think that, the circumstance of the brood of cestode worms being found so abundantly in the blood-vessels, shows that the blood is their most usual course of migration. KÜCHENMEISTER believes that both courses of migration are followed by penetrating the tissues, and by the blood. The *Trichina* having found a resting place, a cyst closely adhering to the tissues is formed around it. This cyst consists of concentric layers of a fibrous or lamellar substance, with imbedded cell-nuclei. The brood reposing in this cyst approximates the head and caudal extremities in spiral turns, without, however, contracting a part of the head, and is then perhaps surrounded, even on the part of the worm, with a peculiar layer, but certainly enveloped on the part of the host, with a capsule and cyst, in which the worm increases in size; and, besides the intestinal canal, develops the primitive foundations of an organ which belongs to the generative apparatus. The material for the capsule or cyst enveloping the *Trichina*, according to LUSCHKA, is formed from the inflammatory exudation produced by the passage and site of the worm; and hence the cyst varies in appearance with the time which has elapsed since the immigration, the oldest cysts exhibiting granules of lime-salts combined with an organic substance, this deposition of lime-salts increasing with the age of the cyst. SANDERS and KIRK state that there are around the worm—1, an external fibrous envelope; 2, a tolerably thick layer of a white, transparent, homogeneous substance; and 3, an internal round capsule.

119. b. The contents of the cyst consist of one or more animals, and a small quantity of fluid, which keeps the inner envelope extended (which envelope KÜCHENMEISTER and LUSCHKA believe to be derived from the animal itself); the fluid is sometimes clear, especially in the comparatively young *Trichinae*. In cysts with worms recently dead or destroyed, it showed traces of organic decomposition. In cysts with worms which have been long dead, or in those which contained no worms, which are rare, is found a clear, thickish fluid, with small formative elements, or only a few elementary granules. These wormless cysts probably had previously enclosed a *Trichina*, which had died, and that a complete solution of the worm had taken place, or which had migrated from the cyst, and wandered to some other situation, where it had again become encysted.

120. As to the destination of the *Trichinae*, there is no doubt that a great number, if not all, of those which occur in the muscles of man, become abortive and die. The latter then lie in their cysts, in the midst of the cyst-fluid, which is in course of sebaceousification, desiccation, and calcification, rolled in spiral convolutions, in the same way as the *Trichinae* seen in a living state. These spiral structures are, however, broken up into fragments, which indicate a ringed appearance or a segmentation of the bodies of these animals. "But how these encysted nematode worms, with our present state of civilisation, can reach, before the period of their death—which, however, only occurs very late, perhaps in 30 to 40 years, or after a still longer period in particular cases—places in which they are in a position to pass through their further and higher development, is beyond my power to divine" (KÜCHENMEISTER). On this subject, the experiments of this writer, and of ZENKER and LEUCKART, have thrown no light.

121. c. The reasons which have induced KÜCHENMEISTER to regard the *Trichina* of OWEN and LUSCHKA as the young brood of *Trichocephalus dispar*, and to consider both these nematode worms, hitherto placed separately as belonging to one species, are the following:—1. The skin of both has a peculiar ringed and jointed structure, which presents itself more distinctly than in many other *Nematoda*. 2. In both, a longitudinal stria runs down the sides, indicating the limit to which the contractile parenchyma of the worm, in which its internal organs are imbedded, reaches. These striæ are certainly the points of attachment of the parenchyma to the inner wall of the integument of the *Trichina*. 3. The alimentary canal is organised in exactly the same way in both. The mouth and anus are situated exactly in the centre of the two extremities of these bodies, the anterior and posterior; this circumstance excluding the *Ascarides*, *Oxyurides*, and *Strongyli*, and most of the *Filaria*, from any relationship with *Trichina spiralis*. 4. The second tube which occurs in the abdomen, together with the intestinal canal, favours the identity of the two worms; the course of this tube admitting of being so developed as to produce either female or male *Trichocephali*. For these reasons KÜCHENMEISTER regards the *Trichinae* as the brood of *Trichocephali* engaged in migration, by swallowing which we infect ourselves with the *Trichocephalus dispar* of both sexes. The symptoms produced by these worms have not been observed or stated. Even the immigration of the brood of *Trichina* appears to take place without any general reaction, and is also borne without injury for many years.

122. ii. OXYURIS=sharp-tail (from ὄξυς and εἶψά). This name applies only to the female, but by no means to the male. This worm is differently classed by DUJARDIN and DIESING, whose classifications are too artificial, and too subdivided to admit of notice at this place. The *Oxyuris*, according to DUJARDIN and most other authors, is a genus of *Nematoda* separated from *Ascaris*. This writer gives the subjoined systematic description of it.\*

\* "Corpus cylindricum aut fere fusiforme, sublongum, in femina retrotruncum subulatum; caput inerme; os rotundum (in statu contractionis) aut triangulare (in statu relaxato)." A U A

123. *A. Oxyuris vermicularis*, BREMSER, DUJARDIN, VON SIEBOLD, GOETZE, RUDOLPHI, DIESSING, &c.; *Fusaria vermicularis*, ZEDER; *Kinder-, Mastdarm-, Madenwurm*; *Thread-worm*.—*a*. Three forms as to size, sex, &c., of these worms are met with:—1. The mature females, which are remarkable for their size, thickness, and whiteness, for their acute capillary tail, and for an obtuse, broad head. 2. The young immature females resemble the pale-gray colour of the males, but they are somewhat larger than they, and are

recognised by their acute tails, and by the female sexual organs in grades of development varying with their age. 3. The mature males are remarkable by their pale silver-gray colour, and their obtuse anterior and posterior extremities, as also by the penis. All the three forms occur abundantly in one and the same intestine. The skin, head, and œsophagus, and intestine are similar in both sexes. The nervous system of the *Oxyurides* is, according to WALTER, greatly developed, although hitherto overlooked. They have both cephalic and caudal ganglia, with other ganglia, plexuses, and lateral filaments, which are minutely described by WALTER and KÜCHENMEISTER. The primitive nervous filaments are produced from the processes of the ganglionic cells; by the union of several primitive filaments of this kind, narrower or broader branches are produced. The skin of the oxyurides consists of an external epidermis, and beneath this a delicate but densely fibrous corium. The parenchyma of the body does not extend into the tail. The muscular system is highly developed. The alimentary apparatus consists of a mouth, œsophagus, stomach, intestine, rectum, and anal cleft. For a minute description of these and of the sexual organisation, my limits oblige me to refer the reader to the works of the authors just named, who ascertained that the males of the oxyuris vermicularis are much more numerous than was formerly supposed.

124. *b*. The locality of these worms in the human body is the lower portion of the intestinal canal, especially the rectum. They occasionally stray upwards, but rarely higher than the lower part of the small intestine. They wander, however, out of the anus and into the vagina of females. Although most frequent in boys and young persons, yet they are not uncommon at all more advanced ages, even in the most aged, in whom I have repeatedly found them the most tormenting. They are gregarious, forming balls in the large intestines, frequently along with other worms, especially the *Ascaris lumbricoides*. J. P. FRANK found them in the intestines of an infant so young that the umbilical portion of the chord had not separated. They are, of all the *Helmintha*, the most frequent tormentors of every age and of every people; for they are not limited to particular parts of the world.

125. *c*. *Symptoms*.—These vary with the number of the worms and their position. A few hardly occasion any marked symptoms; but when numerous, in the lowest part of the rectum, they occasion extremely distressing itching and an irritating annoyance, difficult to be described, extending to adjoining parts. Certain articles of diet, as onions, carrots, fruits, &c., render the worms more restless and irritating during the whole day; but they are generally most annoying when the patient goes to bed. When the patient falls asleep, grinding of the teeth, excitement of the sexual organs, and restlessness are caused by them. The consequences of this local and constant irritation are, especially at, and subsequently to, the period of puberty, increased sexual irritation, masturbation, &c., in both sexes, and in the female sex most distressingly when the worms wander into the vagina, when they occasion not merely pruritus but also leucorrhœa, &c. The loss of rest and the irritation they produce, ultimately impair nutrition, give rise to pallor, anaemia, and loss of

flesh; irritation of the nostrils, sneezings, discoloration of the countenance, or a dark circle around the eyes, dilated pupils, and various sympathetic phenomena.

126. *d.* The *Diagnosis*, however, of these thread-worms can be established with certainty only by examining the fecal evacuations, especially after the administration of an enema. The *prognosis*, although the complaint is unattended by danger, is not favourable as respects either a speedy or a permanent cure.

127. *iii.* STRONGYLI\* and their *Allies*. — This genus of worms has been often described; but, of the less recent writers, more especially by RUDOLPHI and BREMSER. The species which most particularly interest the physician is —

128. *A. The Strongylus gigas.*† — *Ascaris visceralis aut renalis*, GMELIN; *Lumbrii in renibus*, BLASIVS; *L. renalis*, REDI; *Fusaria visceralis aut renalis*, ZEDER. KÜCHENMEISTER remarks that BREMSER has shown this worm, which occurs, although rarely in the abdominal cavity, the omentum, but especially in the kidneys and urinary bladder, more rarely in the lungs and liver, and only when strayed in the intestinal canal of martens, dogs, wolves, seals, otters, oxen, and horses, is still more rare in man; and that a number of those accounts of worms passing off through the urinary passages are delusions. Since a minute knowledge of the pathology of the kidneys has been acquired, it may be inferred that many of these cases would be recognised as fibrinous casts thrown off in the urine during disease of these organs. That these worms are extremely rare, even in the kidneys, must be admitted, since KÜCHENMEISTER has never met with a case in his own practice. He has, moreover, thrown rational doubts on the authenticity of most of the cases on record, showing that these cases, at least some of them, may have been instances of mistaken diagnosis. DR. LANKESTER, however, states that there is a fine specimen of this worm taken from a human kidney in the Museum of the Royal College of Surgeons of England.

\* "A. Strongyli veri. Corpore subcylindrico, utrinque attenuato; capite nudo rarius alato, 2 appendicibus laterilibus armato; ore terminali, nudo vel sex papillis instructo, vel orbiculari; œsophago triangulari, musculo; cute tenui. Mas: appendice multilobata aut radiata; penis simplex vel duplex, multilobatus, ad digitum instar. Femina: caudâ obtusâ, rectâ; ano in parte caudali; vaginâ anterosam sitâ; utero simplici aut bilocari; ovulis moenis (900—912 mill.). Animalia ovi- aut vivipara." — KÜCHENMEISTER.

DUJARDIN arranges the *Strongyli veri* as the sixth Genus of his *Nematodes*. DIEBING places the two species, *Str. gigas* and *Str. longivaginatâ*, in his Gen. liv., *Eustrongylus*, thus defined by him: "Corpore subcylindrico, utrinque sensim attenuato, capite corpore continuo, ore terminali, orbiculari, papilloso; bursa maris terminali, integra; pene filiformi longo, hanc vaginatâ; vaginâ aut anterosam aut retrorsam sitâ, Systemati gangliorum distinctissimo. Animalia ovi- aut vivipara, extra tubum intestinalicem habitantia."

† "Corpore rubro, cylindrico, longissimo, utrinque attenuato, striis aut annulis transversis interruptis et 8 fasciis fibrarum longitudinalium instructo; capite obtuso, truncato; ore orbiculari 6 papillis aut nodulis planiusculis, appropinquantibus; œsophago 15—22 mill. circiter longo, tenui et angustiore quam canalis intestinalis.

"Mas: corpore anterosum magis attenuato, 140 ad 140 mill. = 10" — 1" longo, 4—5 mill. lato; caudâ obtusâ cum bursâ membranacâ patelliformi, circa 3 mill. latâ, truncatâ; pene tenuissimo simplici.

"Femina: corpore utrinque attenuato, 2 decim. ad 1 metr. = 2" — 3" longo, 3—12 mill. lato; caudâ magis rectâ, obtuso-rotundatâ; ano triangulari, oblongo, sub extremitate caudali sito; vaginâ anterosam sitâ; utero simplici; ovulis fere globosis." — KÜCHENMEISTER.

129. *a.* When fresh, this worm has a reddish colour. In spirit this colour fades, and the worm assumes a greyish leaden hue. Four longitudinal stripes are observed on it. The total length of a female specimen was 19 Saxon inches. DUJARDIN states that the vagina opens 1 to 2 inches from the caudal extremity. DIEBING says that the ganglial system of nerves is most manifest in this worm, a remark which is confirmed by BLANCHARD, OTTO, and VON SIEBOLD.

130. *b.* The symptoms of this worm are equivocal, for there can be no evidence of its existence to be relied upon, until it is discharged, thereby demonstrating its existence. Another species of *Strongylus*, the *S. longevaginatâ* of DIEBING, has been said to have been found in the human subject, but without sufficient proof.

131. *iv.* ANCYLOSTOMUM.\* — *Ancylostoma*, DUBINI; *Ancylostoma*, CREPLIN. — This worm was found by DUBINI in Milan, in 1838, in the duodenum, and upper part of the jejunum; and subsequently also by PRUNER, BILLHARZ, and GRIESINGER, in the countries watered by the Nile. According to VON SIEBOLD, it has never been found in Europe to the north of the Alps. DUBINI established this as a distinct genus from the *Strongyli*, by the symmetrical arrangement of the dental apparatus. We are, however, at present acquainted only with a single species of it.

132. *A. Ancylostomum duodenale.*† — BILLHARZ, having had his attention called to this worm by VON SIEBOLD, in consequence of PRUNER having found it in Egypt, observed it in every body he examined after death in that country, sometimes in small numbers, sometimes in hundreds, less in the duodenum than in the jejunum, between the transverse folds of the mucous membrane. One male is found to three females. At the oval end, a large, obliquely truncated horny capsule, furnished with four strong teeth on the projecting portion of the upper margin, is seen. The oval orifice is turned to the surface opposite to the sexual and anal orifices. The animal attaches itself by its mouth so firmly to the mucous surface

\* "Fermes subcinerici, vivipari, corpus cylindricum; caput aliquid attenuatum; pharynx infundibuliformis, colore subfusco, parietibus resistentibus. Its acetabuliforme, subcornucum; apertura oris ampla circularis subdorsalis; dentes in fundo oris intra aperturâ marginem abdominales 4, uncinati (os in altitudine infundibuli 4 unciatis inclusit recurvatis sessilibus et in fundo cum eminentiis concavis, in lobulis uncinatione unguis legumenerarii) nominatis, in uncinis carnosus, qui ad clavâ communibus, Dublin; œsophagus carnosus, qui ad clavâ instar inter descendendum longitur; cutis transverse striata, unde 2 eminentiæ conicæ prominent, uno aliter opposita, inter scetam anteriorem partem longitudinis vermiculi totalis et inter reliquas posteriores vermiculi partes, quæ quinquies scetam longitudinis totalis partem exhibent; anus lateralis et aliquid ab extremitate caudali remotus. Extremitas caudalis maris bursam terminalem integram subus excisam multiradiatam exappendiculatam; pene duplicem longissimum exhibens; feminae obtusa, aperturam genitalem retrorsum sitam præbens." — DIEBING et DUBINI.

† "Caput apice rotundatum; oris limbi papillis conicis inaequalibus, duabus minoribus, uncinis papillis impositis apicibus convergentibus. Corpus subcinctum v. parum curvatum, anteriore parte transparente, ventriculo globoso nigrescente, posteriore flavido-jusco, maris anterosum attenuatum, extremitate caudali inflexâ; bursâ cyathiformi bilobâ 11-radiatâ, cujus radii sita sunt papillæ, ut triplicem eorum ordinem conspiciere possit, in utroque enim latere ordinem quatuor, media in partem trivium radiorum (radius lateralis utriusque 5 simplicibus; Diebing); radio dorsal apice furcato; femina extremitate posticâ acute conicâ. Longit. mar. 3—4"; fem. 4—5"; crassit. ad 1/4". — DIEBING et VON SIEBOLD.

that the mouth is torn away when it is detached by force. Its nourishment is blood, as proved by its intestine being filled with this fluid.

133. *a. Pathology.*—This worm is of great interest and importance, and is often fatal to those afflicted with it. GRIESINGER, the best chemical observer of this worm, states that this worm attaches itself firmly by biting into the mucous and submucous membranes; and that the spot on which a worm has been attached is indicated by an ecchymosis of the size of a lentil, in the centre of which, a white spot, the size of a pin's head, appears, which is pierced by a hole penetrating into the submucous tissue. From these wounds the blood enters freely into the intestine of the worm, which is filled with blood from the punctured places. Frequently the mucous membrane of the intestine is studded with flat, livid, brownish-red elevations of the size of a lentil. This is owing to the collection of the blood between the mucous membrane and muscular coat. In some cases a specimen of the worm is found lying in the cavity thus formed, covered with blood, with which it has completely engorged itself. The manifest consequence of this infestation is *anæmia*. GRIESINGER imputes the "*Egyptian chlorosis*," which he had previously described, and which, he avers, attacks one fourth of the population, entirely to the presence of this worm.

134. *b. Symptoms.*—At an *early period*, pallor of the face, general surface, lips and gums; palpitations of the heart, especially on any exertion, sounds in the jugular veins on auscultation, lassitude, debility without emaciation, are the chief phenomena. Subsequently disordered digestion, irregularity of the bowels, and *Catarrhus intestinalis* are complained of. These symptoms may continue an indefinite time; but if not removed by a decided treatment, the consequences are most serious and generally fatal. Emaciation often does not commence until late in the disease. *Edema* of the extremities and eyelids; a pale yellowish or greenish yellow hue of the general surface; a withered, dry, flabby, and cold state of the integuments, and a remarkable pallor of the outlets of mucous canals; remarkable apathy, and sense of exhaustion; constant and distressing palpitations, the sounds of the heart being often heard at the distance of several feet; murmurs in all the larger arteries, and a rushing or purring sound in the jugulars, slowly supervene. The pulse is uncommonly quick and small; the respiratory movements are weak, frequent, and short; the urine is abundant, pale, and rarely contains albumen. Giddiness and headache are commonly experienced. Constant hunger, singular appetites, and slight febrile movements, sometimes with enlargement of the spleen and atrophy of the liver, are observed. With indulgence and full diet this state may last for years; but in very many cases the progress of the malady is rapid. Even in the best circumstances the patient is pallid, sickly, and miserable, exhibiting a high degree of *anæmia* and *hydræmia*. Various acute affections often supervene and complicate the disease, and a chronic diarrhoea or dysentery ultimately carries off the patient. Fainting labour, a lowering or antiphlogistic treatment, and debilitating agents hasten dissolution. A restorative regimen, change of climate, and judicious treatment, often arrest the complaint. All the phenomena consequent on the presence of

these parasites are characteristic of a very slow but continued loss of blood, which, if not arrested, goes on until the quantity and the quality of this fluid are no longer sufficient to sustain life; *death* supervening with faintness, dyspnoea, and fatal syncope.

135. *e. On examination after death*, the organs and structures generally are wasted, pallid and softened. The spleen is often enlarged; the liver is pale and atrophied; the veins are nearly empty; the heart and large venous trunks contain only soft, small brown coagula, with very little fibrine. In many even of the large venous trunks there is only a dark serous-looking fluid, with a few pale, large, and colourless blood-globules. The substance of the heart, especially the inner layers of muscles, are very pale and even fatty. This organ is generally large, thick, hypertrophied or dilated, particularly on the left side. The endocardium and valves are often irregular, as if thickened in parts. The brain, the lungs, the muscles, the digestive mucous surface, &c., exhibit remarkable pallor and *anæmia*; the cellular tissue and muscles being softened, flabby, and in parts exhibiting a watery infiltration (§ 134.).

136. *v. THE FILARIE.\**—These form the seventh genus of the first class "*Nematodes*," of DUJARDIN, and the fortieth genus of the sixth order, "*Nematoidea*" of DIESING. From the *Gordii* they are distinguished by structure, mode of life, the nature of the youngest brood, and by the circumstance that they readily burst in water, like other *Nematoda*, which is not the case with the *Gordii* (DIESING).

137. *A. Filaria Medinensis.* † — PLUTARCHI refers in the ninth question of the eighth book of his "*Symposiacon*," to the statement of AGATHARCHIDES of Cnidus, the geographer and philosopher, "That the people on the Arabian side of the Red Sea suffered many strange diseases; amongst others, worms, like little snakes (*δρακόντια μικρά*), came out upon them, which gnawed their legs and arms, and when touched retracted themselves, coiled themselves up in the flesh, and gave rise to the most insupportable pains; but that this evil

\* *Diagnosis*: "*Ferme albi, subfusci, aut rubri, corpore filiformi, elastico, cylindrico, ut plurimum longissimo; capite corpore continuo, incerti aut spinulæ rectæ et cornis (dentibus seu papillis prominentibus Anteriori) armato; ore terminali non labiato, vel labio rotundo, aut triangulari; œsophago brevi, tubuloso, rectiore quam intestinum; ano terminali aut ante caudæ apicem sito; cute lævi aut leviter oblique striata.*"

† *Mas*: caudâ plerumque obtusâ, interdum membranâ accessoriam aliam exhibente; spiculis filiformibus in vagina tubulosa aut liguliformi, ex Dujardino inæqualibus, curvatis (?). *Femina*: vagina antrosum prope ad os sita, plerumque duplici (*Filaria rigida*) aut multiplici (*æc. quinqueloculati in Filaria lactata, Nathusius*); oris duplici aut globosis, lacertibus. *Nunc ovivivane viviparæ.*"

‡ *Mares omnino ignoti aut potius ab oculo rursus neglecti et omisi, quin ob minorem magnitudinem somnari efficiunt et molestias et dolores et via usquam angustis tumores; sed uti Diesingius ipse enarrat, a Chittlandi in Calcutta Journ. of Nat. Hist. I. 350, Pl. X., fig. 1. delineati.*

§ *Feminae*: corpore longissimo (ad 2 unctas et aliquâ supra), subulbo, filiformi, subæquali, secundum Dujardinum antrosum, sed secundum Diesingium et quosdam quod ipse affirmare possum retrosum, aciem attenuatâ, ad 1<sup>am</sup> seu ad 1-24 mill. lato; ore orbiculati, apicibus 4 cruciatim oppositis; caudâ ad apicem uncinatâ, sub-acutâ, in apice 0.065-0.082 mill.=0.028-0.032<sup>am</sup>. Par. = 0.029-0.037<sup>am</sup>. *F. lato*, interdum in vermibus spinis cute ita affixa, ut viz apicem liberum facere possit; vagina ovulis; embryonibus 1<sup>o</sup> longis, via 1<sup>o</sup> lato. Species viviparæ.—KÜCHENMEISTER.

has been found only then, and neither before nor since amongst any other people." Many authors, with much appearance of justice, believe that the fiery serpents, which MOSES states to have been so destructive to the Israelites when journeying in the vicinity of the Red Sea, were *Filaria Medinensis*, and consequently that MOSES is the first writer to notice this worm, and that the fiery inflammation produced by it, gave rise to the appellation bestowed upon it by the Hebrew writer.\* That the *Filaria* was considered a species of serpent by the ancients, is proved by the Greek name δρακύντιον, *dracunculius*, which was given it, and by the inflammation, pain, and swelling which occurred with the breaking out of the worm. The mortality amongst the Israelites may be explained by their ignorance of the proper treatment, and of the danger consequent upon the breaking of the worm. AVENZOAR states that, in his country, "Æger in continenti post dolorem vehementem in parte affecta exortum moriatur." The distemper being endemic in the place where the Israelites were sojourning (in Arabia Petrea), in circumstances of great difficulty and even distress, and during the hygienic privations of encampments in a barren country, it is not surprising that it then and there assumed an epidemic and fatal character.

138. **SYNON.** The *Filaria Medinensis* has received a variety of names, viz. the *Dracunculius*; the *Drac. tiliarum*; the *Drac. Persarum*; the *Guinea-worm* or *G. thread-worm*; from its frequent occurrence on the coast of Guinea; the *Guinea dragon*; the *Guinea hair-worm*; *Pharaoh's worm*; the *Skin-worm*; the *leg-worm*; le *Dragonneau*, le *ver de Guinée*, le *ver Cutané*, by the French; *Guinischer Fadenwurm*; *Guinische Drache*, *Pharaohswurm*, by the Germans.

139. *a.* Our knowledge of the natural history of this worm, and of the early stages of its development, is very deficient. KÜCHENMEISTER states that it is of the thickness of packthread, its anterior extremity obtuse, the mouth circular, without lips, but beset with four hooks, or more correctly with four styles, or acute straight spines; the vagina

opens in the vicinity of the mouth, and the vagina and uterus are probably double, as in most *Filaria*. The length of the worm varies from several inches to three yards. Statements of greater dimensions are probably founded in error. The whole surface of the worm and its tail exhibit the well-known fine rings, placed at an uniform distance. The substance of the body is homogeneous, finely granulated, and exhibits no traces of muscular fibres. Its œsophagus, intestinal canal, uterus, &c., require no description.\*

140. *b.* The worm is indigenous only in the hot zone, and, even when transported into colder climates, does not appear to propagate itself. Even in the hot zone it does not occur everywhere, but only in particular countries, like all the *Helmintha*, and is entirely in certain places in affected countries, as, for instance, in the Gambia, Angola, Canlabah, &c. The places in which the *Filaria Medinensis* more particularly occurs, are Senegal and the coast of Guinea, the East Indies, Persia, Arabia Petrea, the coasts of the Red Sea, especially towards the south, the shores of the Ganges, Bombay, the Caspian Sea, Upper Egypt, Abyssinia, Nubia. It was introduced into America by Negro slaves, especially into Surinam. Throughout the countries now mentioned it attacks aborigines and foreigners without distinction. According to PRUNER the worm often becomes epidemic, in wet seasons and in marshy districts. BREMSER states that it is most frequently seen in the East Indies from November to January (the rainy season); and in Upper Egypt, according to BILHARZ, shortly after the inundations of the Nile.

141. *c.* The mode of production of the worm is still enveloped in obscurity. English officers, who never went about with the feet and arms uncovered, remained free from this worm. PRUNER thinks that the germ of the worm is an independent marsh animal, which is converted into a *Dracunculius* within the human body. FORBES believes that he found the brood of the *Dracunculius* free in the red, ochrey mud of the drying marshes. However, the aborigines think that it comes from the marshy grounds into the skin. The ordinary seat of the worm is the sub-cutaneous cellular tissue, especially of the lower extremities, around the ankle. It may, however, occur under the skin and muscles in all other parts of the human body. Instances of its occurrence in other parts of the body besides the extremities are recorded by KÄMPFER, BAJON, BAILLIE, PERÉ, and have been seen by myself in Africa. M'GREGOR, in 172 cases, states that it occurred 124 times in the feet, 33 times in the lower, 11 times in the upper part of the thigh, twice in the scrotum, and twice in the hands. PRUNER found a specimen behind the liver, between the layers of the mesentery. Sometimes the worm lies coiled up in a small space, sometimes it is extended; and in the latter case, if it lies on the surface, it feels as a varicose vein. PERÉ saw it lying in a snake-like form under the whole of the skin of the abdomen and

\* Upon referring to a translation of the Bible from the Hebrew into Latin, with very copious annotations, by IMMANUEL TREMELLI and FRANCIS JUNIUS (the former a learned Rabbi converted to Christianity, the first and second editions of which, published in London in 1579—80, and 1584 in quarto, are in my library). I find that he translates the Hebrew description as follows:—"Tum immisit Jehovah in populum illum serpentes presteres, qui morderunt populum; ita moribatur populus multus ex Israele." Here TREMELLI translates the Hebrew into venomous serpents; but in a note he states, that according to the original they were fiery serpents. To this translation of the Bible and to its copious annotations, the translators of King James's Bible, and modern annotators, are more indebted than has been made to appear. Upon referring further to the very rare edition of the Vulgate, also in my possession, which was printed in 1481, and known by the term "*Fonibus ex Græcis*," &c., the serpents are called "fiery serpents—(Misit Deus ignitos serpentes)—which inflicted wounds and death on many." This edition of the Bible is in folio, on a thick, beautiful paper, the ink being a bright jet-black, without the name of either printer or publisher, and without the verses being numbered, but with the initial letters illuminated and coloured. These translations vary only in the term "venomous" being used by the former for "fiery;" whilst the statement in the latter, that these serpents "inflicted wounds and death on many," may be considered as nearer the truth, as the infliction of wounds does not imply that death was always the result. Some translations, which retain the appellation "fiery," very justly explain it by stating it to refer entirely to the inflammation and pain produced by these animals.

\* BREMSER gives the following systematic description of this worm:—"Longissima cylindrica, elastica, ferè equilatera crassa, capite attenuata, ore minimo, circulari, cauda maris medium sui finis ad locum, quintali spirali, prominente, subulata, inflexa; feminae semperotè, acutiuscula, incurva prædita; in hominibus tela cellulosa subcutanea, præsertim pedum; in regionibus tropicis sæcè solita."

a part of that of the chest, and similar cases of its extension are on record. "These examples will suffice to give a clear idea of this worm, of which, moreover, as many as twenty-eight, thirty, nay even fifty specimens have been observed in one man" (KÜCHENMEISTER).

142. *d. Diagnosis.*— If the worm is superficial, with a hard substratum, its growth is seen to take place with extraordinary rapidity, from 4<sup>th</sup> it becomes several inches long in a couple of days. It is then easily killed by poultices of boiled garlic, after which it is absorbed without injurious consequences. Frequently the worm occasions little or no annoyance for a long time. DAMPIER and ISERT had quitted the district of these worms for 6—8 months, and WENGLER's patient for 4—6 months before the worm betrayed itself. According to KÄMPFER and others, this latent state may continue 12—15 months, and in rare cases, even until the third year. In other instances, emaciation, notwithstanding a good appetite and absence of fever, takes place, terminating at last in fatal exhaustion. When the worm is making its way out, a small pustule appears at the point where it will break through, sometimes with, and sometimes without, preliminary annoyance, or headache, pain in the stomach, nausea, fever, &c. At the point where it breaks through, inflammation, swelling, and suppuration occur several days previously, and continue until the worm is extracted. If it lies over or near to a joint, the use of the limb is prevented, and the symptoms are still more severe. In the case of DRUMMOND, after pain and stiffness of the leg, a reddish swelling, with a black point in the centre, was formed above the inside of the ankle; and at the same time he felt a firm, round, catgut-like substance twisted under the integuments. About three weeks after the first sensation of stiffness, he was seized with a sudden insupportable itching over the whole body, with fever, violent colic, vomiting, and purging; after which, shiverings without perspiration followed. In the mean time the swelling had burst, and a hard white substance appeared, but so deep that it could not be laid hold of, the animal having buried itself deeper amongst the muscles. The cat-gut-like twisted substance formerly felt was not now present. In the following night the ankle and vicinity were much inflamed; and three days afterwards a thread was passed round the animal, and a bloody ichorous discharge continued for six or seven weeks from the wound, which healed up gradually to a small point, when the worm again came forth, and was fastened with a thread, rolled upon a stick, and drawn out twice a day. In twenty days the extraction was completed. Two or three days after the formation of vesicles on the inflamed part these open up, or are opened by a lancet, when matter, blood, and sanies, and two or three inches of the anterior end of the worm came forth. If this end be carefully pulled several inches, more often follow. All this is coiled around a little roll of linen, or a small stick, and fastened over the wound with a compress and adhesive plaster; and the worm is thus wound out by repeated, careful operations, twice daily. The worm rarely comes away on the first attempt, several days, or even weeks, being required before this is accomplished. Mr. Busk, in the *Transactions of the Microscopical Society*, has given one of the best descriptions of this worm.

143. vi. ASCARIDES.— These worms are arranged by DEJARDIN as the nineteenth genus of the *Nematoda*; and by DIESING as the twentieth genus of the sixth order of the *Achæthelmintha elastica*, but the *Oxyuri* are also introduced by him into this genus. The classification of DIESING is so involved that more confusion than elucidation is the result. Refining, hair-splitting, and drawing distinctions, which are either observed with difficulty, or not at all, are not the least faults of some modern observers. I subjoin DEJARDIN's systematic description of this genus.\* The only species to be here noticed is the—

144. *A. Ascaris lumbricoides.*— SYNON.: *Ascaris gymnoascarida*, DIESING; *Ascaris lumbricoides*, LINNÆUS; *A. gigas*, GOEZE; *Lumbricus teres*, AUCT; *Fusaria lumbricoides*, ZEDER; but the Linnæan name is very generally retained.†

145. *a. Description.*— The head of the worm is distinctly composed of three papillæ, which can undoubtedly be spread out upon the intestine, in a broad, circular, sucker-like surface, in the sucking act of the worm. BREXNER has seen the opening and closing of these papillæ, and described the mechanism. He even reports that at the moment of opening he saw a little tube protrude from the centre, which is the true oral orifice. WEDL. thinks that this is the cleft proboscis, which is everted from the oral aperture for the reception of nourishment. The true oral aperture is, however, formed by the opened lips or papillæ; the

\* "Ascarides: corpore albo aut subflavo, subcylindrico, utrinque attenuato, fusiformi, 4 striis longitudinalibus subalbis, opacis, linearibus, instructo; cute transverse striatâ; capite tubus, testibus (lobis) convexis aut semilunariibus, interne fenestratis; œsophago valde musculo, cylindrico aut claviformi; ventriculo cavitate triangularem præbente.

† "Mas minor quam femina; extremitate caudali aliquid curvata et involuta, nunc nulla, nunc membrana alata duplici, aut duplici tuberculorum et papillarum ordine aut rarissime acclabulo instructâ caudâ breviori, obtusiore, quam in feminis; spiculo aut pene duplici plus minusve longo et arcuato.

"Femina caudâ rectiore et longiore; vaginâ simplici antrovisum sitâ; utero bi- aut multiloculari; ovario filiformi, longitudinali, duplicibus aut multiplicibus; oviductu elliptico aut globuloso, rectis laevibus. Sperma aut ovi- aut viviparâ, plerumque in tubo intestinali sitentia."

† "Fermes albi aut rubro-pallidi, cylindrici, in extremitatibus attenuati, fusiformes elastici & cute transverse subarticulata striis transversis 0.02 mill. inter se distantibus, ex duobus stratis composita, 4 lineis lateralibus longitudinalibus subalbis majoribus, capite distincto, parvo (0.7 mill. lato), tribus tubulis semilunariibus, prominentibus, ad margines hyalinis armato, interne benticulatum musculostratum ad galli juba modum præbente; œsophago musculo, 6—8 mill. longo, filiformi, triquetro, ventriculo claviformi (0.7 mill. lato, 2—5 mill. longo) parvulo, intestino simplici tubuloso aut villis et epithelio polyedrico sparsim instructo.

"Mas: 150 ad 170 mill.—4 ad 6<sup>th</sup> Jong., 3.2 mill. lat., cauda aliquid depressa, conica, inflexa et curvata, spiculis 2 plantis, subensiformibus, fere rectis, 1.8 mill. ad 2.12 mill. longis, 0.18 ad 0.23 mill. latis. Organum spermaticum simpliciter, 1200 mill. longo, testiculo circo parvo, recto (formi), semiculo spermatico albo-attenuato, ductu ejaculatorio angustiore ad ani latus sese aperiente. Spermatozoïdia globuliformia, granulosa, in femina vagina maturæcencia.

"Femina: 200 ad 275 mill. et supra longæ: 8 ad 18<sup>th</sup>; media in parte 4 ad 5<sup>th</sup> mill. lata; caudâ convexâ obtusâ; aut aliquid ante caudâ apicem sito (1 mill. circumscripto); vaginâ simplici ante corporis dimidium sitâ, et masculinâ sine femininarum variabilî (ex c. 85 mill. pene equali in femina 245 mill. et 103 mill. in femina 214 mill. longa); utero ab initio simplici, bipartito aut biloculari. Oviductu filiformi, sensim attenuata, rectoriam usque ad ovum, et antrovisum supra vaginam aliquantulum prægenita. Totalis utriusque ovarii longitudo ad 4<sup>th</sup> Lys.

"Ovula immatura subtriangula, numero 4 ad 8 conglomerata, matura isolata, rotunda, ad 0.087 mill. lata, cum testâ tenui, laevi; in natura libera sensum embryonicæ evolentia."—KÜCHENMEISTER.

small tubule in the centre represents the *introitus faucium*. Its protrusion is probably as much by its own muscular structure as by the contraction of the general muscular structure of the body. The males and females may be distinguished by their form and external appearance. The abdomen of the female is slender, and fusiformly pointed. The male is bent like a hook, and sometimes presents, a short distance from the tail, a pair of white, delicate, projecting hairs, which are the protruded penis. If the female be pressed, or allowed to swell in water, a prolapsus of these tubes (ovaries), and a discharge of a milky substance (eggs), takes place in the anterior half of the animal from the vaginal orifice. If the male be pressed, a milky juice (seminal globules) flows out in the vicinity of the anus, without the occurrence of a prolapsus. The intestinal canal is whitish and muscular at its commencement; the œsophagus is composed of thick layers of longitudinal and transverse fibres, and passes rapidly, and without any marked constriction, into the intestinal canal, the parietes of which are thin, internally covered with epithelium, and slides through, of a brownish colour, from the brown excrement. This intestine has a muscular coat, which is connected with the cutaneous longitudinal and circular muscles. The external integument consists of six layers. Under the outer layer are two layers of fibres crossing each other obliquely, and two laid at a right angle over each other, and between the former and latter two a sixth homogeneous layer, which appears to contain a peculiar odorous fluid, of an oily and reddish appearance, and exhibits refractive phenomena (KÜCHENMEISTER).

146. *b. Symptoms.*—Very generally the host and his guests, the *Ascarides*, agree very well together, until, owing to causes affecting these animals, or the digestive organs of their host, a disagreement between them takes place, and various disorders or symptoms ensue. When these worms are few in number, notwithstanding their size, they often occasion but little disorder, and live amicably with their entertainer on unelaborated chyme, until their numbers, changes of diet, and other occurrences produce more or less ailment. In most cases, when their numbers are not great, a good, or a too good appetite, is the chief injury they do; and in this respect they are much less noxious than the much smaller *Ancylostoma*. Great numbers of these worms in the intestines, and a firm aggregation of them into coils and knots, sometimes with the small thread-worms intervening, often occasion much disorder, according to the mechanical obstacle and the irritation they may produce. Colic, ileus, constipation, diarrhœa, flatulency, congestions of the brain, especially in children, and various reflex phenomena manifested in distant parts, and on voluntary muscles both of the trunk and of the lower extremities, are then not unfrequent occurrences. Besides the influence of inordinate numbers—of 200—350—knotted into balls, which I have expelled from the bowels of both children and adults, the irritation and the consequent effects produced by even small or moderate numbers are often serious; for, owing to states of the digestive organs of their host, to the influence of certain kinds of food, or of change of diet upon them, or to the agitation arising in them from the influence of season, and to the

periodical seeking of the females by the males, much disturbance may ensue, or the worms may travel or stray into parts of the digestive canal not usually visited by them, and thus induce very serious effects; which may even terminate in death. These effects, however, will depend much upon the irritability and other circumstances of the patient, the number of the wanderers, and the parts which they have reached. When irritations of the intestinal canal occur, and produce watery diarrhœa, cholera, &c., these worms are thereby affected; they swell up, lose their powers of adhesion, and are often carried away *per anum*. But one or more worms may pass unusually high in the intestines, may rise through the pylorus into the stomach, and occasion retching, vomitings, &c., irritation in the œsophagus, fever, delirium, and upon the discharge of the worm all rapidly disappear. But before rising so high in the digestive canal, one or more may pass into the common duct, or even into the cystic, or the hepatic, or the pancreatic ducts, and produce symptoms similar, or approaching to gall-stones, or inflammation, spasm, and disease of these ducts. These latter occurrences are, however, very rare; for generally the secretions passing along these ducts into the duodenum are not much relished by these worms, and these routes are not pursued by them. When the worm passes into the stomach, it may rapidly rise into the upper part of the œsophagus, or into the pharynx, and even get entangled in the larynx and produce the most distressing effects. But such occurrences, although observed, are very rare. After long periods of abstinence or inanition they have been found to migrate and escape from the anus, mouth, and nose; and such migrations are not uncommon in the course of continued and remittent fevers.

147. The symptoms produced by *Ascarides*, whilst they continue in the intestine, are mechanical, direct, and reflex. The former are the phenomena of the usual caterpillar affections of the stomach and intestines (gastro-intestinal irritations) in every grade; costiveness, tormina, colic; a sense of weight, of irritation, or of a ball, or gnawing and itching near the umbilicus; disordered, craving, and irregular appetite, and digestion, &c. The latter are hiccup, subsultus of the abdominal muscles, cramps of the lower extremities, yawning, increased secretion of saliva, snuffling or tickling of the nose, but rare of the anus, unless upon the passage of a worm.

148. The question has been often entertained as to the possibility of these worms perforating the parietes of the healthy intestines, and making their way into places more or less distant from their usual residence. That these worms can never perforate the healthy intestine; the structure of its head, and its thin lips being adapted only for suction and not for boring, is the opinion of RUDOLPHI, BREMSER, ROKITANSKY, BERBERGER, J. P. FRANK, KÜCHENMEISTER, and myself, in opposition to that of VON SIEBOLD and MONDIÈRE. Therefore it may be concluded that when these worms are found in situations external to the digestive canal, they have reached it by some pre-existing ulceration, perforation, or fistula.

149. Many, especially of the older authors, have attributed a prognostic and generally an unfavourable import to the discharge of worms during febrile diseases, and more especially during typhoid

fevers; and this opinion is not limited to the *Ascarides*, but is extended to the flat worms, and they have argued that the worms in these circumstances are like the rats, and have the prescience of deserting a sinking ship! But as the discharge of worms from a fever-patient does not occur until after the seventh day, according to ZIMMERMANN, it is much more probable that they travel from the intestines, owing to the food obtained by them being insufficient or not suited to them, and to the secretions of the intestines being injurious to them, and in search of more abundant or more suitable aliment. The ulcerations of the intestines and the morbid matter from these ulcers in the advanced stages of continued fevers, will also tend to expel or to occasion a discharge of these worms, which, when observed, may be justly viewed, both as an indication of the existence of these lesions, and of the extreme danger of the malady.

150. VI. A GENERAL VIEW OF THE SYMPTOMS PRODUCED BY WORMS IN THE DIGESTIVE CANAL.—Most of the symptoms produced by worms may arise from other causes; but a careful recognition and observation of these symptoms, of their successions, grouping, &c., are requisite for the due regulation of the treatment, and for the ascertaining of the species of worm which is present. The symptoms produced most commonly by the individual species of worm have been noticed with reference to each; but recent writers have been more intent upon the microscopic descriptions of these parasites, and upon drawing minute distinctions, &c., than upon more useful and practical considerations connected with them. It is justly argued that the discharge of the more common species of worms infesting the intestinal canal is the only true *diagnosis* of verminous diseases; but this discharge, even in the most serious cases, may not occur without means being used to effect it; and it is by a knowledge of these symptoms, independently of such discharge, that we are led to administer the means most likely both to establish this diagnosis and to effect a cure.

151. A. The more direct and local symptoms, or those more immediately caused by worms are—a capricious and variable appetite—at one time, a craving and insatiable hunger or an unsated desire of food; at other times, nausea, or cardialgia, borborygmi, loathing, retching, or vomiting, being present; a sense of weight in the abdomen, with distension, gnawing, or erosion; a feeling of cold internally, or of emptiness or inanition, often with palpitations, or leipothymia, or faintness; a dragging, twisting, or lancinating pain in the abdominal regions, especially near the umbilicus, or tormina, spasms, colicky attacks, tenesmus, constipation, or irregularities of the intestinal functions; leucorrhœa, and itching, or a mucous or watery exudation from the anus, sometimes a mucous diarrhoea, tenesmus, and bearing down pains in adult females, or derangements of the catamenia, or even abortion; and in children, more especially tormina, colic, constipation, and intus-susception of the bowels, with various cerebral symptoms about to be noticed. In both sexes “manustratio” is not infrequent, even at an early age.

152. B. The symptoms caused in more distant parts by sympathy with the seat of irritation, or by direct and reflex sympathy, are chiefly a frequent, dry, and tickling cough; hiccup, anxiety at the præcordia, or pungent pains passing under

the false-ribs and at the epigastrium; a sense of something in the œsophagus, sometimes with tickling in the pharynx; partial amaurosis and dilatation of the pupils; sneezings, itching and dryness of the nose and nostrils, sometimes epistaxis, itching of the skin, without eruption; grinding or grating of the teeth, and sudden startings when asleep; subsultus and spasms of the abdominal muscles; partial or general convulsive movements without complete loss of consciousness; chorea or twitchings, or irregular contractions of particular muscles, especially those of the face and lower extremities; and more or less fully developed, general, or epileptic convulsions. The urinary excretion is sometimes disordered, and dysuria or frequent micturition complained of, the urine being whey-coloured, turbid, &c., with, or without a sediment.

153. C. A general *Verminous Cachexia* is not infrequently present, manifested by a pale, tumid, or livid state of the features; by a sunken appearance of the eyes and a leaden hue beneath them; a general pallor, and more or less anæmia of the surface of the body, lips, &c.; a perverted state of the sense of smell, or the entire loss of smell; a strawberry hue of the tongue, or mucous sordes on the tongue, and about the teeth and gums, stridor of the teeth, and a peculiar foetor of the breath, sometimes a more or less evident affection of the voice and speech; a morose, irritable state of temper, vertigo, frightful dreams, timidity, somnolency; slight or low delirium, risus sardonius, and prostration of strength. The biliary secretion is sometimes scanty, and in some cases even jaundice is observed. The abdominal secretions are very often disordered, and the functions of excretion generally impeded. These and other effects—local and sympathetic—are manifestly produced—1st, by the irritation of the digestive mucous surface, which may, in the cases of certain worms, and in susceptible constitutions especially, go on to inflammation and its consequences; and, 2nd, by the changes these animals produce in the chyme and chyle derived from the ordinary food, and upon the secretions of the gastro-intestinal surface, and upon those of the liver and pancreas. The former of these effects, namely, those consisting of gastro-intestinal irritation and its consequences, will also contribute to the production of the latter; but it cannot be doubted that much of the nourishment which should be taken up by the intestinal surface is intercepted by these parasites, whilst a portion of the fluids, lacteal or serous, are removed from this surface by the suction exerted by these animals.

154. All the symptoms now enumerated are not observed in the same case, but many of them either co-exist or appear in succession, and are variously grouped in different subjects, so as to render a diagnosis very difficult between this and other complaints. When the cachexia, debility, and sympathetic disturbance of the brain and its functions are considerable, more especially when the circulating fluids are diminished in quantity from deficient aliment, or impaired in quality by imperfect assimilation and depuration, the symptoms may assume a febrile character, sometimes mistaken for a form either of low fever, or of gastric fever; but more correctly recognised by some of the older writers by the term worm- or verminous fever. (See also § 73.)

155. vii. THE CAUSES OF WORMS may be inferred from what has been stated above; yet it may be of use to notice some particulars too generally overlooked by the recent writers, who have insisted upon the propagation of worms by means of ova, &c., and who may be considered as having disproved the doctrine of equivocal generation — or more correctly of spontaneous formation. A knowledge of the *predisposing causes* furnishes important indications in both the prevention and the treatment of verminous diseases; for, although the obsolete doctrine of spontaneous formation rendered this knowledge of the greatest interest, inasmuch as it was founded upon antecedent changes in the constitution, yet these changes are by no means devoid of influence in favouring the development of the ova and embryos of parasitic animals. There can be no doubt, that children of weak, aged, and vitally exhausted parents; the female sex, debilitated males; and persons of all ages, who have been insufficiently or improperly fed in early life, or of a relaxed fibre or asthenic diathesis, are much more subject to worms, than those who are otherwise circumstanced. A tender and delicate state of health in early life; the use of crude, viscous, gelatinous, and vegetable food; whatever tends to lower the organic nervous force and vital resistance; a relaxed and asthenic habit of body; hereditary conformation; a residence in crowded and insufficiently drained cities and towns, or in cold and moist situations, especially in those which are abundantly covered with vegetable productions peculiar to the country, and a scanty use of such condiments, as salt and hot spices, as the climate may require, predispose to the generation of worms. In places where salt cannot be obtained in quantities requisite to the wants of the oecomy, as in some intertropical countries, the hot spices are used in its place by the natives. Those who contend, and, from recent researches, with manifest truth, that the presence of ova is necessary to the generation of human parasites, consider that the predisposition produced by these causes favour this generation, and that robust health and a sound constitution are subversive of their development. Those who argue for their spontaneous formation believe that these causes not merely predispose to this formation, but also directly produce it; and that, owing to a weak and imperfect chylification and assimilation, or to a metamorphosis of the secretions, a material is evolved, which, under the favourable circumstances in which it is placed, and owing to a vital emanation from the body in which it lodged, assumes an organised and separate existence. These doctrines, however opposite — the former assuming, as predisposing causes, merely what the latter contends to be direct and exciting, or efficient, causes — agree in that, which is of the greatest importance to the physician: they both point out the best indications for preventing the continued, or the future, generation of worms, where they already exist or have existed, and for guarding against their invasion in circumstances which render such invasion more or less probable.

156. IV. TREATMENT OF WORMS.—The treatment of worms should have reference — 1st, To their *prophylaxis*, or prevention; — 2d, To their *expulsion*; — and 3d, To the *prevention of their recurrence*.

157. i. PROPHYLAXIS.—A, As to the first of these

*intentions*, it must be admitted, that the accomplishment of it is always difficult, and often impossible. Our knowledge also of the modes and channels by which these parasites are conveyed into, and propagated by, the lower animals and human subjects, is imperfect. Admitting that they originate in ova which experience the changes in the processes of their development above described, we still find it difficult to account for the presence of these ova, and for their passage into the human stomach. That the ova, as stated above, may attach themselves to raw vegetables and fruit, is not improbable. The feeding of domestic animals also upon the garbage or viscera of fish, fowls, or the mammalia, certainly favours the production of worms, especially those of the cestoid order, in these animals; and the ova from these, where perfect cleanliness in all respects is not observed, may be conveyed in the food or drink, or by the hands, especially unclean hands, into the human body. The amount of knowledge as to this topic appears to be limited to the observance of perfect cleanliness in all its bearings, including the utmost care as to the purity of the water used, and as to the use of raw vegetables and fruits. Marsh, stagnant, and even river water ought not to be used; or if the latter be taken, it ought to be previously boiled or filtered. Vegetables and fruits should be carefully washed, especially fallen fruit, if eaten in a raw state; and the domestic animals ought to be confined to their proper places, and neither petted nor fondled. The diet is also of some consequence; and no kind of animal food should be taken, unless it be sufficiently cooked. The raw flesh of animals, especially of pigs, and imperfectly cooked viscera of animals, and all unnatural modes of living, and neglect of the strictest attention to cleanliness in respect of diet and modes of living, should be most carefully avoided.

158. B. But it is not only the *prevention of the ingestion of ova* into the human body that should be studied, but also the *means of rendering these ova inert, or rather of preventing their development* in the digestive canal. As with the former, so with the latter means of prevention, our knowledge is very imperfect. We may, however, infer, that those *predisposing causes* of worms, enumerated above, should, as much as possible, be removed or counteracted. Without a due attention to the removal of the predisposition, which favours the generation and development of the entozoa, the treatment of verminous diseases will prove inefficient as regards the issue, and empirical in practice, especially when viewed in relation to the scientific application of the resources which the progress of knowledge and the discoveries of our contemporaries have placed within our reach. In furtherance of this indication, the diet and the treatment should be adopted that are most efficacious in promoting the organic nervous force, and the tone of the digestive organs, and in removing tenacious mucus and pituitous sordes, which often adhere to the digestive mucous surface, especially in asthenic, leucophlegmatic, and debilitated subjects, and which often form the nidus in which the ova of parasites are lodged and hatched. It will generally be noticed that the secretions and excretions, which, in all persons, form the principal part of the faecal discharge, are seldom thrown off from the secreting surfaces so quickly and en-

tirely in the delicate and debilitated as in the robust and healthy; but remain, or are retained, in the former class of subjects, and become the soil in which these animals are reared.

159. C. Persons who are, or who have been, subject to verminous diseases, ought to adopt that kind of food, and to have recourse to those medicines, which their feelings and observation indicate as being calculated to distress, injure, and ultimately to destroy or eject intestinal worms. A due attention to such means is required not only for the expulsion, but also for preventing the future generation of these parasites. Another object, and one, indeed, which is the basis of the prevention and of the treatment of worms, is to determine, in as accurate a manner as possible, from the character of the symptoms, and from the examination of the faeces, the *species* of the animal which is to be dislodged. While, however, this diagnosis receives its due attention, care must be taken not to mistake other diseases, which possess many of the same features, for those proceeding from the presence of worms. This error is likely to occur frequently, since the one class of disorders often reciprocally bear the relation of cause and effect to each other. Nor, in many cases, will it be attended by any serious consequences, farther than from wanting appropriate direction, the treatment must be inefficient, and redundant and superfluous. It should also be kept in recollection, that worms are more apt to be generated during fevers, and during convalescence from fevers, especially such as are epidemic, adynamic or nervous, or are gastric or exanthematous, than in robust health, or even in other circumstances. The generation of parasitical animals in these maladies is not confined to the surface of the intestinal canal only. It is not unusual to observe the parasites, usually produced, in favourable circumstances, on the external surface of the body, become remarkably abundant during and after these fevers, especially when the diseased secretions are allowed to accumulate from a neglect of ablutions and of frequent change of linen. The appearance of animal parasites on these occasions was explained by the supporters of spontaneous formation, in the way above noticed (§§ 6, *et seq.*); whilst it was viewed, by the believers in generation from ova, as the result of a more favourable occasion being furnished for the development of the ova during these diseases.

160. One of the earliest methods of preventing and of curing verminous diseases, resorted to by many physicians, is to remove, or attempt to remove, by purgatives or drastic means, the tenacious mucus adhering to the digestive mucous surface, and which, as they believe, forms the nidus or lodgement of worms; and they believe that the quantities of mucus dislodged from the bowels during and for some time after the exhibition of vermifuge, and other purgatives, are proofs of the accumulation of this mucus on the intestinal surface. That this mucus or sordes may be excessive, in many cases, may be admitted; but it may also be allowed, that the greater portion of this mucus is produced, by the irritation of the intestinal mucous membrane, by these purgatives. This method of prevention and treatment, when moderately and appropriately prescribed, may be of service in many cases; but it should not be overlooked, that the rough operation of these me-

dicines often leaves a debilitated state of the intestines after their operation, which disposes them to generate, and prevents them from throwing off the mucous sordes and worms which these medicines were employed to remove. They cannot, by any mechanical property, or by any chemical or other influence on the intestinal secretions and excretions, always remove them from the extended surface covered by them in the manner, or so completely as, contemplated; and, even when the proposed end is completely attained, the intestinal functions are left in a more favourable condition than before, to reproduce both mucous sordes and worms, especially if any of the ova still remain unexpelled. Therefore, instead of trusting to the medicines usually employed as anthelmintics, vermifuge purgatives, alterants, &c., our attention ought to be directed (in some cases, instead of these medicines, in others, in addition to them, and subsequently to the use of them) to the adoption of remedies which promote the organic nervous forces, and the digestive and vital energies in general, thereby increasing the healthy and vigorous discharge of the various functions, and the due evolution and evacuation of the secretions and excretions from the digestive organs. (*See also the treatment after the expulsion of worms.*)

161. ii. DIRECT AND CURATIVE TREATMENT.—J. P. FRANK, whose experience of the treatment of worms, when he wrote on the subject, had extended to half a century, considered that drastic purgatives and anthelmintics, at the commencement of the treatment, were seldom so serviceable, especially against tania, as more gentle measures, which, in his opinion, should be first adopted, and be followed by more energetic remedies. But the diversity not only of these medicines, and of the combinations and methods of prescribing them, bewilder the inexperienced, until repeated opportunities of observation enable him to select those means and combinations upon which confidence can be placed. KÜCHENMEISTER justly remarks, that, if the multitude of remedies recommended for any disease is an evidence of their want of power against it, the therapeutics of worms are extremely defective. In truth, the treatment of these parasites leaves much to be desired as respects the efficacy of the medicines prescribed for them, the pleasantness of the most efficacious amongst them, and the disagreeable effects which often accompany and follow those most to be relied upon.

162. A. THE TREATMENT OF TAPE-WORM will firstly, and more especially, occupy attention, as it will comprise the most efficacious medicines and methods which have been employed, not only for these worms, but also for many of the others which have been noticed above; and when the treatment of these latter comes under consideration, then a brief reference to what has already been stated will be sufficient. KÜCHENMEISTER tested a great many of the medicines recommended against tania, by placing live tape-worms in a mixture of the particular medicines with white of egg, and by determining the time in which they died by the assistance of the rotation apparatus, the two poles of which he introduced into the mixture. According to these experiments, the tania lived for many hours, or even for days, in the mixture containing the *cuprum oxydatum nigrum*, in that containing the *dolichos pruriens*; and for several hours in castor

oil, and in a salad made with pickled herrings, onions, garlic, &c. Tin has little or no effect, or merely the same effect as the cow-itch. Electricity has no destructive action on *Tenia*. "It is otherwise, however, with *kouso*, in the infusion of which, mixed with milk, the *tenia* died within half an hour of their introduction; and with oil of turpentine, in a mixture of which with white of egg, they died in 1—1½ hour. In a decoction of *Bryonia* (*kouso*) mixed with white of egg, the *Tenia* died in 1½—3 hours. In a decoction of *rad. punice granatorum*, mixed with white of egg, in 3 hours; and with the same decoction, mixed with milk, in 3—3½ hours. In a mixture of extract. *filicis maris ather.* with white of egg, the *Tenia* died in 3½—4 hours. The so-called *filicine* (*filicic acid* of LUTZ), mixed with white of egg, also has an energetic action on the *Tenia*, which die therein in the course of a few hours, and exhibit oedematous swellings in various parts." The particular methods of expulsion, arranged according to the remedies, have been enumerated by MEYER, SEEGER, and KÜCHENMEISTER; but the faults which this last-named writer finds with his two predecessors, viz. that in the enumeration of methods these are thrown together in a disorderly manner, may also be imputed to himself, although in a less degree.

163. a. METHODS WITH TIN.—FRANK commences the treatment with the powder of tin, or its filings, given in a simple syrup, either alone, or with sulphur, or the *extractum absinthii*. After having pursued this plan during three or four days, allowing only a spare diet, he prescribes, in addition to the tin, a moderate dose of *jalap*, low diet being still observed. DURUS prescribes, without any preliminary treatment, at six, and at half-past six, in the morning, each time a powder of *Stann. rasp. Angl.* ℞ss.; *Tannini puri* ʒi. *Gigutti* (*cambojie*) gr. v.; *Eleosacchari cajuputi*, gr. ijss.; and after each dose, the patient drinks two cups of black coffee. In two hours, the worm is expected to pass off, usually with colicky pains, on the occurrence of which strong black coffee is immediately given. For the subsequent treatment, a tincture of iron is advised. BECKER recommends the chemically precipitated tin. According to him, it is certain in its action, does not irritate the intestines mechanically, and is preferable in doubtful cases. It is, however, difficult to be obtained. KÜCHENMEISTER protests against the administration of tin-filings, as being, in his opinion, a much too irritating medicine. But he has twice prescribed tin, precipitated from chloride of tin, in an extremely fine powder, making it into an *electuary* with honey, a little *extr. punice granat.*, *extr. filicis maris ather.*, and *camboje* or *jalap*. Even young and weakly children support this remedy very well. On one occasion, the entire worm passed, dead, on the second day. In the other case, an adult, several yards passed after this medicine, but the remainder of the worm was expelled by his ordinary mixture (§ 181.). He considers the medicine to be uncertain, difficult to be obtained, and persons who are much reduced. Tin, in various combinations, has been prescribed, also, by ALSTON, MAYER, MATTHIEU, HAUTESIARK, and AUTENRIETH; but its operation, as they have prescribed it, is often either ineffective, or too irritating to the digestive mucous surface.

164. b. METHODS WITH THE MALE FERN.—

*The Aspidium filix mas*, which is always efficacious against the *Bothriocephali*, is much less so against *Tenia*. BUCHHEIM prescribes a soft resin, obtained from this plant, with good effects. The most efficacious preparation, according to KÜCHENMEISTER, is the *atheral extract* of *Filix Mas*, the powder being mixed with the extract, so as to increase the surface of contact of the medicine; or the extract being mixed with pomegranate root, which latter he prefers.—(a.) WAWRUCI'S method is a preliminary treatment of three to four days, consisting of strong beef-tea with white bread, three times a day, taking at the same time the following resolvent:—℞ *Rad. taraxaci et cichorei*, āā. ʒj.; *decoque per ¼ horæ: colature* ʒvj., *adde ammon. chlor. præcip.* ʒj.; *syropi cichorei cum rheo* ʒss. M. Two table-spoonfuls every two hours. With this, daily laxative clysters of milk, linseed, herb. althææ, flor. verbasc., and flor. papaver. are ordered, and on the evening before the expulsion, a very rich gruel (½ lb. of water and 2—4 ounces of butter and wheat bread). The expulsion is attempted by taking, "in the morning fasting, a thick gruel; and about five, six, and seven o'clock, a clyster of linseed and milk; about eight o'clock, two table-spoonfuls of castor oil; at half-past eight, pulv. rad. filicis maris ʒij.—ʒiv.; at nine o'clock, two table-spoonfuls of castor oil; at half-past nine, the fern-powder again; at ten o'clock, two table-spoonfuls of castor oil; and at half-past ten, the third powder. After each dose, the patient washes his mouth with tea made from flor. tilia, and summitat. millefolii; and in the intervals, he chews flavid. cort. aurantior., of which a dose of ʒss. is prescribed. At one o'clock, he takes a powder of camboge and calomel āā. gr. v.—vj., with ʒss. sacch. albi, and applies emollient poultices over the abdomen. If the worm be not expelled, castor oil is again given in half an hour; in a second half-hour, camboge powder; then castor oil again; and possibly, if no inflammation occurs, the powder of camboge and calomel again at half-past four. At the same time, a clyster is administered every hour!" The subsequent treatment consists of the removal of the inflammatory state of the intestines by leeches, mild diet, &c.

165. (b.) *Weisshaar's method* is a modification of the above. On the second, third, and fourth day of preliminary treatment, a pickled herring diet; and on the following day, he attempts the expulsion of the worm nearly as advised by WAWRUCI, excepting that he gives the castor oil in meat broth, and, instead of orange-peel, candied calamus. Of the fern-powder he gives only xv.—xx. gr. pro dosi, with 15—20 grs. olei filicis maris; and even the latter only to irritable subjects. Recently he prescribes 60—80 drops of filicis maris with ʒss. ol. ricini; in half an hour, two table-spoonfuls of castor oil; in an hour, the first powder of camboge and calomel; in half an hour, oil again; in another half-hour, the second powder of camboge and calomel, and so forth. He states that he easily expels *T. solium* by this method; but that *T. mediocanellata* (§§ 68—70.) requires strong doses of oil of turpentine.

166. (c.) *The Wurtenberg method* is one ounce of fern-root boiled for an hour with three pints of water; one drachm of fresh cort. mezerei is added to the hot decoction, which in ten or twelve minutes is strained, and then mixed with two or

three drachms of finely powdered fern-root. This is taken in the morning fasting, either at once, or in three portions at intervals of an hour. In three or four hours, sickness and disorder of the stomach cease; and then calomel, freshly prepared sulphate of iron, aa. gr. x.— $\mathfrak{z}$ j., according to age, are administered, and repeated if vomiting occur. The worm is said to be generally expelled in the evening; when this is not the case, a rich gruel is given on the same evening; and on the following morning fasting, rhubarb and jalap, aa. gr. x.—xv.— $\mathfrak{z}$ ss.

167. (d.) *Alibert's and Dubois' methods* are nearly the same, and as follows:—After a preliminary treatment for eight days, to which garlic, roasted under the ashes, is added, the abdomen is to be rubbed several times a-day with a liniment of camphor, with balsams and nut oil, and with crushed bulbs of garlic, also a pisanne of *helminthocortan* and *filix mas*, and a nightly enema of marsh-mallow water are prescribed. Without this preparation, ALIBERT prescribes—

No. 380. R. Rad. Filicis Maris,  $\mathfrak{z}$ iv.;—Coque cum Aq. Font. lb ij., usque ad remanentiam lb ij.;—Colaturæ adde Syrupi Helminthocort.  $\mathfrak{z}$ ij. M.

This is to be drunk in cupfuls during the day. After three hours of repose, calomel and corn. cerv. ust., of each gr. iij., made into a bolus with conserv. rosæ q. s., are given. In the evening,  $\mathfrak{z}$ ij. of oil of sweet almonds; and on the second day, the following purgative:—

No. 381. R. Scammonii, gr. xvij.;—Rad. Filicis Maris,  $\mathfrak{z}$ j.;—Cambogiae, Calomel. aa. gr. xij. M.

To be taken in three portions in sugar and water. DUBOIS, after the preliminary treatment just noticed, prescribes, early in the morning,  $\mathfrak{z}$ ss. of filix mas in broth; and every half-hour one of the following:—

No. 382. R. Res. Jalap., Scammonii, Cambogiae, aa.  $\mathfrak{z}$ ss.;—Syrupi Rhamni Cathart. q. s. ut fiant Boll. sing. gr. vj.

168. (e.) *Biching's and Seeger's methods.* The former commences with draughts and clysters of cold water, and with full diet and cold baths. With this diet, but without the cold water, according to SEEGER, a saturated decoction of  $\mathfrak{z}$ ss. of fern-root is drunk cold after every meal, when the worm will be expelled in from three to fourteen days. SEEGER'S plan, according to KÜCHENMEISTER, is suited to irritable and weak persons.

169. (f.) *Nuffer's and Odier's method.* The evening before the treatment, the patient takes a thin gruel with two ounces of butter; a quarter of an hour afterwards, a glass of wine, and, if necessary, a clyster. The next morning fasting,  $\mathfrak{z}$ ij. pulv. fil. maris in  $\mathfrak{z}$ iv.— $\mathfrak{z}$ vj. aq. tiliae. If vomiting occur, this is to be repeated; and if sickness be felt, black coffee is taken. Two hours after this, the following bolus is given:—

No. 383. R. Calomel., Scammonii, aa. gr. x.—xv.;—Cambogiae, gr. v.—vij.—vij.;—Confect. Hyacinth. q. s. Misce.

For weak patients and children, in two doses. If the bolus be thrown up, or not have operated in four hours, or if the worm hangs out of the anus,  $\mathfrak{z}$ vj.— $\mathfrak{z}$ j. of Epsom salts, dissolved in warm water, are given. If the worm be not expelled by this, the gruel and powder are to be repeated, but the Epsom salts are to be given instead of the bolus. ODIER directs a table-spoonful of castor oil in meat broth every half-hour instead of the

bolus. This treatment is said to be certain against *Bothriocephali*.

170. (g.) *Blossfeld's and Rapp's method* is much praised. The previous evening, a thick mixture of bread and milk is taken; and in the following morning  $\mathfrak{z}$ j. pulv. rad. fil. maris is given every hour, in an ounce and a half of nutmeg tea. After six or eight doses, the worm is expelled. RAPP directs the root to be fresh, and administers  $\mathfrak{z}$ vj.— $\mathfrak{z}$ j. of it one dose.

171. (h.) *Mayor's method.* MAYOR, of Geneva, regards the root of filix mas as specific against *Bothriocephalus*, and tin and pomogranate root against *Tania solium*, and states that the powder of the fern-root should appear quite green, as it is otherwise inefficacious. He gives  $\mathfrak{z}$ ij.— $\mathfrak{z}$ iv. in a mixture of balm tea and  $\mathfrak{z}$ j. of gum syrup. This draught is to be taken at night, and  $\mathfrak{z}$ jss. of castor oil the next morning. MAYOR, in some cases, instead of the powder, prescribes the oleum filicis maris in the form of pills,—thirty to fifty drops in twenty-four pills, of which twelve are taken at night, and twelve in the morning, and an hour afterwards  $\mathfrak{z}$ jss. of castor oil. In other cases, he gives the fern-oil either pure, or mixed with castor oil, in doses of  $\mathfrak{z}$ ss.— $\mathfrak{z}$ j.; but usually the castor oil afterwards.

172. (i.) *O. Bang's method.* "For three days, the patient takes only one basin of meat broth, with white bread. At night, he has a clyster of warm milk. On the fourth day, he takes also eight cups of black coffee with plenty of sugar, and two to three large pickled herrings in the form of salad, with plenty of vinegar, pepper, oil, and onions. On the fifth day, he takes alternately, every two hours, one third of a herring, and a heaped-up tea-spoonful of pulv. rad. filicis maris, and with this two to three cups of coffee. At night, a milk clyster and a dessert-spoonful of castor oil. On the sixth morning, fasting, two tea-spoonfuls of fern-powder; an hour afterwards, two table-spoonfuls of castor oil, and the same quantity every two hours until the worm is expelled. During this he drinks tea; and, lastly for the subsequent treatment, iron is used."

173. (k.) *Ullersperger's method.* Without any previous treatment, he gives  $\mathfrak{z}$ ij.— $\mathfrak{z}$ iv. of the bark of the roots freshly peeled, treated with alcohol the day before, and lets the patient lie in bed. When no vomiting takes place within two hours, an aperient of 6 gr. calomel and  $\mathfrak{z}$ j. of sapa jalap. in pills is given. This method is said to be rapid and efficacious.

174. (l.) *J. P. Frank's method* is to commence either with the exhibition of tin, as above, and to follow with the *mala fern*, or to begin at once with this latter, giving about three drachms in a draught of cold water, and to give frequently cold diluents, allowing the most rigorous abstinence. A dose of castor oil may be taken the following day, and repeated every two hours until copious evacuations are procured.

175. (m.) *Mayer's and Karsten's methods.* On the day when fragments pass off spontaneously, the patient takes a herring salad at night. At six o'clock next morning,  $\mathfrak{z}$ ij. of fern-powder in  $\mathfrak{z}$ vj. of aqu. flor. tiliae is taken in tea-spoonfuls without stopping, and immediately after this a table-spoonful of castor oil, and then a cup of thin broth. The oil is then continued every half-hour until  $\mathfrak{z}$ ij. are taken. For any sensation of fulness and nausea,

hot black coffee is given. About twelve o'clock, the greater part of the worm is expelled, and the head passes at one or two o'clock. Bitters are prescribed subsequently.—KARSTEN'S method consists of a mild aperient and scanty diet the day before; and early in the morning, ℥ij. of fern-root in teaspoonfuls. If sickness be felt, thin broth is given. Between eleven and one o'clock, the worm is expelled without any further treatment. Several other methods of employing the male-fern root have been enumerated by KÜCHENMEISTER, generally premising various means, the *modus operandi* and utility of which are not very apparent. I shall next notice two other preparations of this root—the *extract* and the *æthereal oil*, which have been used with great benefit. The *compound decoction of male fern*, for which I have given a *Formula* in the APPENDIX, will be found one of the most efficacious modes of prescribing this remedy. (See *Form.* 62.)

176. (n.) *The extractum filicis maris* has been prescribed by several physicians. PESCHIER administers it as follows:—

No. 384. R. Extr. Filicis Maris Æther. ℥j.—℥ss.;—  
Pulv. Rad. Fil. Maris, q. s. ut fiant Pilulæ xx.

To be taken in two portions half an hour before bed-time, after fasting from five o'clock in the evening; next morning an aperient. Several physicians have adopted this preparation and its mode of exhibition with success. KIESEN and HILLER gave the extract, for several days together, to the total amount of ℥ij. with good results. After several days of spare diet, MÖSING gave fifteen of PESCHIER'S pills to the fasting patient at nine o'clock, and again at half-past nine. His prescription is as follows:—

No. 385. R. Extr. Filicis Maris Æther. ℥jss.;—  
Pulv. Rad. Fil. Mar. q. s. ut fiant Pilulæ xxx.

After the last dose, he gave ℥ij. infusi sennæ compos. at once. FUNK administered the extract night and morning with syrup and gum, and afterwards gave castor oil every hour until it operated freely. NOSS prescribed an aperient on the preceding day, and the extract to the fasting patient with syrup—℥ss.—℥ss. of the extract twice with an interval of an hour; then castor oil every hour. ALBENS, after a restricted diet for one to three days, and on the day before the exhibition of the extract, prescribed a purgative of Glauber's salts; and on the following morning, ℥ss. of extract of male fern whilst fasting, and the same quantity an hour afterwards—one to two hours afterwards, castor oil. RAYER gave seventy-two drops of PESCHIER'S thin extract of fern made into pills with the powder of the root, of which eight are to be taken at night, and eight in the morning; two hours afterwards, castor oil. MAGENDIE prepared a *tincture* from the buds of the fern, and made it into pills with the powder of the bark of the root, each containing a drop of the tincture. From eight to twenty were said to be sufficient for expulsion of the worm. The circumstance of no further accounts of the employment of this tincture having appeared, is not in favour of its efficacy.

177. (o.) *The æthereal oil of male fern* has been much employed and praised by Dr. JENNER. He caused the patient to be kept without food for sixteen or eighteen hours, before he gave the oil; and he further recommends the following mode of administering it:—“For an adult, two pills may

be taken at bed-time, containing three grains of calomel, and eight of compound colocynth pill; the following morning, a dose of castor oil. A little broth only should be given till the bowels have been thoroughly cleared out. As soon as that object is effected, one drachm and a half of oil of male fern is to be given on an ounce of some aromatic water; and the dose of oil of male fern is to be repeated in six hours, if the first dose has not proved effectual before the expiration of that time. For a child, calomel and jalap may be substituted for the colocynth and calomel. The dose of the oil of male fern must be as large for the child as for the adult; seeing that its action is on the parasite, and not on the patient, I have never seen any unpleasant results follow its employment in the child.” I have, in several cases, given the male fern successfully, when connected, many years ago, with public medical institutions; and since the publication of Dr. JENNER'S interesting paper on the use of the æthereal oil of male fern, I have prescribed it in two cases—in one with complete success, but in the other it failed. In this latter, the oil of turpentine and the kouso had been prescribed separately and after considerable intervals, and both had failed, portions of the worm only having come away. An opportunity, however, was not afforded me of persevering in the treatment beyond the exhibition of two doses of two drachms each. The oil was procured from an undoubted quarter. I give, in the subjoined note, Dr. JENNER'S account of his experience with this oil.\* In a case, recorded in

\* “The anthelmintics chiefly employed in cases of tape-worm in this country, are turpentine, kouso, pomegranate, and male fern. The objection to turpentine is its horribly nauseous flavour, and its very unpleasant effects on the head, and occasionally on the kidneys. It is a remedy which should be used only as a last resource. Kouso is expensive and bulky. Pomegranate is bulky and nauseous, and, as ordinarily obtained in this country, not very certain in its action. Male fern has the advantages of being inexpensive, only moderately disagreeable in flavour, so that children take it readily, of small bulk, perfectly innocuous to the patient, and more certain than the other agents in its action on the parasite. It is one of the oldest of the remedies for tape-worm, and one of the very best. The preparation I have used is the æthereal oil. An aperient was given in the morning, the patient was kept without food for sixteen or eighteen hours, and then one or two drachms of the oil of male fern were administered on a little cinnamon water.

I have notes of twenty-four cases to which the oil of male fern was given. Sixteen of these cases were cured by a single dose. In three of these sixteen cases the head was found; three of the remaining thirteen were ascertained to be well two years after the administration of the oil, one a year after, one seven months, two six months, three four months, one three months; and before the other two ceased to be under observation, a second dose was given by way of precaution, as it was to all the patients when the head was not found, without any tenia coming away with the stool.

Three required two doses of the drug; in one of these three, some yards of tenia were expelled by the first dose; for two months after this no joints were found in the stools, then a few appeared, and a second dose was given, and was followed by the expulsion of nine yards of tenia; the patient continued well two years after this. In the second case, three yards were expelled by the first dose; and a month after, five feet by a second dose; at the expiration of four months and a half, the patient continued well; in the third case, five and a half yards of tenia were expelled by the first dose, and seven yards by the second, given two months after the first.

Three doses were required in two cases. The first dose of the oil, however, given to one of these cases, was not of good quality. In one of the two, three days elapsed between the first and second dose, and four hours between the second and third. In the other, two days elapsed between the first and second dose, and one between the second and third. In both cases the head was obtained.

In one case, viz., that of a child five years and six

the same journal (August 30, 1856, p. 733.) by Mr. SYMPSON, two drachms of the æthereal oil of male fern, given without preparation, brought away the *Bothriocephalus* in three hours after their exhibition, the worm being voided in two portions with its head connected with the part last voided.

178. c. METHODS WITH POMEGRANATE BARK.—DIOSCORIDES, CELSUS, and PLINY mention the *radix punicea granati* as a vermifuge; and in the East its reputation as an anthelmintic remedy has been great from time immemorial. It was introduced into Europe early in this country by BUCHANAN, BRETON, FLEMING, and others. SEEGER states that of 419 cases treated with it up to 1852, 371 are reported as complete cures, 24 as doubtful, and 24 as unsuccessful. KÜCHENMEISTER adds that he could considerably increase the number of successful cases, partly by his own observations, and partly by those made by others, according to his method—this appearing to be his favourite remedy. The following inferences are stated by him as to the preparation of the bark:—1st, All experiments to ascertain the active principle of the bark of the *radix punicea granati* have failed.—2d, This bark is often adulterated, or contains much impurity.—3d, The bark of the root is more active than the bark of the trunk;  $\frac{3}{4}$  of the former =  $\frac{3}{4}$  of the latter. The bark of the branches has no action.—4th, The fresh bark acts more gently than the dried bark, but more of it is required;  $\frac{3}{4}$  of fresh bark =  $\frac{3}{4}$  of dried bark.—5th, According to several authorities, the East Indian bark—which is thicker—should be preferred to the European.—6th, “After maceration for at least twelve to twenty-four hours, the bark is well boiled; and, according to CENEDELLA, it is better made in earthen than in metallic vessels; it is filtered while hot, as, on cooling, active substances appear to be thrown down again. The decoction was formerly

months old, between the 15th of July and the 4th of August inclusive, five doses of castor oil, and as many of oil of male fern, were administered without a decided effect; a few joints of tenia only being expelled. On the 17th of August, twenty grains of the extract of male fern, obtained from Duncan and Flockhart, of Edinburgh, were given without effect. On August 23rd, one pint of infusion of pumpkin seeds; on September 1st, decoction of pomegranate; and on September 5th, infusion of kousoo; all produced copious evacuations, but no tape-worm. The child now left the hospital. In November he was readmitted, and, during my absence, was treated with success, by my friend Dr. BALLARD, with the oil of male fern. This time the child was kept for forty-eight hours with little, if any, food, before the oil was given. The child was free from tape-worm some months after he left the hospital.

“One man took the oil two or three times without any good effect, but then large quantities of solid feces were discharged from its action; and before it could be administered in a more effectual manner, the patient escaped observation.

“Among those cured by a single dose, and well two years afterwards, was one man who had taken kousoo three times, and oil of turpentine twice. Several of the others had taken turpentine and other remedies with permanent good effect. In three cases (children), the patients rejected the oil by vomiting; with one exception, all admitted that it was much less nauseous than castor oil. In no case did it cause griping or other unpleasant symptoms. The shortest time after taking the oil in which the worm was expelled, was half an hour; the longest, twelve hours; the ordinary time four hours. A large quantity of tenacious yellow mucus was usually expelled either with or before the worm, and often, also, when no worm was present, as when the oil was given to ascertain that no worm remained, the head not having been found.

“In no case was the worm alive when expelled, and in no case was it expelled entire.”—(Association Med. and Journ., Aug. 23, 1856, p. 718.)

most generally used, but I prefer the extract. The best method of preparing this is as follows:—

No. 386.  $\mathcal{R}$  Corticis leviter contusi Rad. Puniceæ Granati,  $\mathfrak{z}$ iv.; macerentur per horas xxiv. cum aqua destill.  $\mathfrak{lb}$ j.; posthac coque in leni calore per horas xij. ad remanentiam  $\mathfrak{z}$ vj. et cola.

To be taken in three to four doses at intervals of from half an hour to an hour.—7th, According to German physicians, the fresh bark, or the extract prepared in the East Indies from the fresh bark, is to be preferred. Even the fresh bark, cultivated in Germany and in green-houses, is more efficacious than the dried bark. WAITZ's extract, prepared from the fresh bark in the East Indies, is very active; the dose of it being  $\mathfrak{z}$ j.— $\mathfrak{z}$ ij.—8th, “The most efficacious form, under all circumstances, is the solution of the extract in a certain quantity of water. The extract itself, made into an electuary with honey, or administered in pills, is to be recommended where there is great tendency to vomit; but on the whole, in aqueous solution is the best.—9th, An alcoholic extract is also recommended by DESLANDRES, and recently by MARTINS; and an æthereal extract has been prepared by WAITZ in Java. Of the latter,  $\mathfrak{z}$ ij.— $\mathfrak{z}$ iv. are administered in  $\mathfrak{z}$ v. of fennel water with syrupi corticis aurant.  $\mathfrak{z}$ j., in three doses, at intervals of half an hour.—10th, Although boiling water is, to a certain extent, sufficient for the preparation of the active substance of the bark, yet the addition of caustic potash or soda, or of a little white wine to the water employed in the maceration, and afterwards in the decoction, of the bark, greatly increases the efficacy of the extract.—11th, Bark which has been long kept is to be rejected as inefficacious.—12th, KÜCHENMEISTER has recourse to another method of preparing the decoction and extract beside that advised above (6th). It is as follows:—

No. 387.  $\mathcal{R}$  Cort. Rad. Puniceæ Granati,  $\mathfrak{z}$ ij.—Pulv. Rhamul Cathart.  $\mathfrak{z}$ j.—Aqueæ Destill.  $\mathfrak{lb}$ ij.—Liq. Kall Causticæ Concent.  $\mathfrak{M}$ x. Macera per horas 12—14; coque leni calore in balneo vapor. per horas 12 ad remanentiam extracti.

The woody parts are to be removed by washing and pressing some time before the conclusion of the evaporation; the washing water being evaporated with the rest. A quantity of this extract, corresponding with the dose of the pomegranate bark prescribed, is to be dissolved in  $\mathfrak{z}$ vj.— $\mathfrak{v}$ ij. of hot water; and, before administration,  $\mathfrak{z}$ j.— $\mathfrak{z}$ ss. extracti filicis maris æther. may be added, when it is desired to combine the two extracts. (See § 176.)

179. d. METHODS OF PRESCRIBING POMEGRANATE BARK.—(a.) Recent bark.—BOERHAAVE prescribes  $\mathfrak{z}$ vij. of fresh bark of the root to be boiled with three pints of water until two pints remain, and drunk in cups, at short intervals, until the worm is expelled. KÜCHENMEISTER says that, by this violent vomiting, colic and purging are produced. BRETON recommends  $\mathfrak{z}$ ij. of the fresh bark to be boiled down from  $\mathfrak{z}$ xvij. to  $\mathfrak{z}$ ix. or, according to GOMEZ, from  $\mathfrak{lb}$ ss. of water to  $\mathfrak{lb}$ j., and this decoction to be taken by cups. MÉRIAT advises  $\mathfrak{z}$ ij. of fresh bark to be infused all night in  $\mathfrak{lb}$ ss. of water, and left to macerate through the night, and to be boiled down to  $\mathfrak{lb}$ j. in the morning. After being filtered and well pressed, this decoction is to be taken in three equal parts within two hours. If vomiting occur after the first dose, this should not prevent the

following doses from being given; but if the patient vomit these, the treatment must be desisted from. According to SCHMIDTMÜLLER, after one day's fasting, and the administration at night of  $\mathfrak{z}$  ij. of castor oil,  $\mathfrak{z}$  ij. of fresh bark are macerated for twelve hours in  $\mathfrak{z}$  xij. of water, and concentrated to  $\mathfrak{z}$  vj.; this is taken in three doses within an hour. KÜCHENMEISTER remarks that, "in all these methods, evacuations take place without purgatives, as the fresh bark usually acts as an aperient itself; and in this lies the great advantage of the fresh bark, and a principal cause of the great uncertainty of most of the previous methods, in which the dried bark was employed. To produce the aperient action with certainty, the dried bark needs the addition of purgatives. According to my experience, the neutral salts and the true drastics, such as jalap, are greatly to be preferred to the oils." The decoction of fresh pomegranate bark may also be prescribed as stated in the APPENDIX. (See Form. 69.)

180. This writer prefers the extract. radices punice granati, prepared according to the prescription given above (§ 178. No. 387.), to all other remedies for tape-worm with which he is acquainted; for, in almost every case of expulsion by this medicine, the worm was passed in one piece with the head, or unbroken and in a single coil — sufficient reason, in his opinion, for endeavouring to make the administration of this remedy more agreeable, and its results still more certain.

181. (b.) *Combinations of pomegranate bark and male fern.* — This was attempted by VON KLEIN, and afterwards by KÜCHENMEISTER. The latter prescribed it as follows: —

No. 388. R. Extracti Radicis Punice Granati Aequal quantum est ex Rad.  $\mathfrak{z}$  iv.— $\mathfrak{z}$  vj. solve in Aq. Destill. Pervide  $\mathfrak{z}$  vj.—vlij. Adde Extr. Filicis Maris Æther.  $\mathfrak{z}$  j.— $\mathfrak{z}$  ss.; — Extr. Tanacetii Vulgaris,  $\mathfrak{z}$  ij.; — Cambogie gr. iv.—vj. ad x. Misce.

A cupful to be taken in the morning fasting; a similar dose in three quarters of an hour. The third is kept in reserve. If the worm be not expelled in an hour and a half after the second dose, the last portion is also to be taken. If vomiting occur, a table-spoonful of the medicine is given every ten minutes; and, to alleviate the tendency to vomit, the patient is recommended to gargle, after every dose, with fresh milk, without swallowing any of it. Small pieces of candied citron or lemon-peel are allowed between the doses. If no evacuation have occurred three hours after the first dose, and the worm have not been expelled, an aperient is administered. "With *tania solium*, castor oil is usually sufficient; one to two table-spoonfuls every half-hour or hour; or: —

No. 389. R. Cambogie gr. vj.—vlij.; — Pulv. Rad. Jalapæ, gr. x.—xv.

To be repeated in two hours, if required." With *T. medicanellata*, this writer has found the best results with the following aperient: —

No. 390. R. Calomelanos, gr. iv.—vj.; — Pulv. Jalapæ gr. x.—xv.

To be taken at once. After the expulsion of the worm, he advises no treatment, excepting tonics in cases of great weakness.

182. (c.) *The preliminary treatment, advised by KÜCHENMEISTER, is as follows:* — At the seasons of fresh strawberries and grapes, he gives half a pint of these fruits every morning, fasting, for six

to eight days; and on the evening before the expulsion, a herring salad with plenty of vinegar, onions, raw and boiled ham, and plenty of oil; and to very costive persons,  $\mathfrak{z}$  j. of castor oil; after which the patient may drink a large glass of light Rhenish wine, or a glass of bitter beer. If the fresh fruits are not to be had, the salad alone will suffice. In very obstinate cases of *Tania medicanellata*, he allows the patient to take as much confection of senna with extr. tanacetii vulg. ( $\mathfrak{z}$  ij. to the ounce of the confection) as will produce two soft motions daily; he then takes the mixture, and not before. Fasting the night before is not advised, as the medicine does not agree well with an empty stomach.

183. e. *METHODS WITH OIL OF TURPENTINE.* — I have prescribed this medicine both as a preliminary means variously combined, and as a direct remedy, or after little or no previous treatment. As a preliminary medicine, I have most frequently given it in the following form: —

No. 391. R. Olei Terebinthinae,  $\mathfrak{z}$  ij.— $\mathfrak{z}$  iv.; — Ætheris Sulphurici (vel Spirit. Ætheris Sulph. Comp.),  $\mathfrak{z}$  iv.—vj.; — Tinct. Camphoræ Comp. (vel Tinct. Benzoinæ Comp.),  $\mathfrak{z}$  ss.; — Olei Cajuputi  $\mathfrak{M}$  xij.—xx. Tere cum Pulv. Tragacanth. Comp.  $\mathfrak{z}$  iij., Pulv. Glycyrrh.  $\mathfrak{z}$  ij., et adde Syrupi Rosæ et Syrupi Tolutani, aa.  $\mathfrak{z}$  jss., Aquæ Destill. ad  $\mathfrak{z}$  vlij. Fiat mist. cuius capiat cochl. j. vel ij. larga, 4tis vel 6tis horis, prius agitata phialâ.

Cold water, or linseed tea, barley water, &c., may be taken frequently during the continuance of this medicine; and in some cases, as soon as any indication of disorder of the urinary functions occur, a full dose of either castor oil, or of calomel with camboe or jalap, so as to freely evacuate the bowels, should be given. Frequently a considerable portion of the worm is expelled by these means; but, nevertheless, the male fern, or its æthereal oil, or the pomegranate bark, should be taken, as prescribed above (§§ 164—181.), a few hours after the exhibition of the purgative; or, in other cases, a few hours before, especially if the bowels have not been long confined.

184. KÜCHENMEISTER states that "the dose of this remedy is  $\mathfrak{z}$  ij. at once, in the morning, fasting; and, if no stools result, another  $\mathfrak{z}$  j.— $\mathfrak{z}$  ij. afterwards (FENWICK and COPLAND); or  $\mathfrak{z}$  j. olei terebinthinae, made into an electuary with honey, &c., in two doses at night before going to bed (THOMPSON); or  $\mathfrak{z}$  ij.—ijss. (SCHMIDTMANN); or with the olei filicis maris (MAYOR). Or the patient, for three days, is allowed to eat only water-gruel with small portions of white bread, three times a-day; and on the next day, when fasting, to take the following: —

No. 392. R. Olei Terebinthinae,  $\mathfrak{z}$  j.; — cum Vit. Ovorum, ij.; — Sacchari Albi Subacti,  $\mathfrak{z}$  ss. M.

and if the worm is not expelled on this day, the dose is repeated on the following day (MERCER). Some also give  $\mathfrak{z}$  ij.—ijss., one half in the morning, and the other at night." This is one of the most effective agents against tape-worms, as LANGR, KÜCHENMEISTER, and others admit. The latter of these writers states that tape-worms laid in turpentine mixed with white of egg, died within one hour and three quarters; and that the touch-stone of a remedy for tape-worms is not whether it expels *Bothriocephalus latus* or *Tania solium*, but whether it is also capable of expelling the *T. medicanellata*. That the oil of turpentine is efficacious in the latter case, he can prove; for the finest specimen of this last-named worm was ex-

pelled by it. In general, it acts with tolerable rapidity, and entirely. This latter circumstance he regards as a requisite of a good vermifuge in cases of tape-worm, especially as the doctor and the patient are anxious to ascertain the expulsion of the head of the parasite.

185. The principal objections to this substance are its nauseous taste, the inclinations to vomit, the unpleasant eructations, griping pains, and disorders of the urinary excretion, it often occasions. It more frequently produces these unpleasant effects when taken in the form of an electuary. When prescribed in the form of mixture, as above (§ 183.), or suspended by white of egg, or taken either pure in a full dose (ʒj. —ij.), or with the addition of castor oil, on the surface of coffee, or milk, or on any aromatic water, at bed-time, or early in the morning, it is generally the most efficacious, and least likely to produce any of the above unpleasant symptoms. It is often taken, with less discomfort, on the surface of Hollands or common unsweetened gin. When castor oil is not given with it, and when it does not act on the bowels in a few hours, either a full dose of castor oil, or of some one of the purgatives already mentioned, should be taken without delay.

186. *f.* METHODS WITH KOUSSO.—*Kosso*—*flores koussu*—the dried and powdered flowers of the *Bruyera anthelmintica*, has lately been much in vogue against tape-worm. It has been supposed, by several physicians, to have been adulterated. KÜCHENMEISTER supposes that it is not so much adulterated as mixed with other Abyssinian medicines against tænia, as with the powder of the root of *Verbascum ternacha*, and with the powdered leaves of *Jasminum floribundum*. The dose of the powder of koussu is ʒvj. to ʒj. I have prescribed this remedy in four cases. In the first, successfully in the case of a medical man in Hertfordshire; the entire worm with the head having been brought away, after turpentine and some other anthelmintics were said to have failed; but in two cases, with only a partial benefit; and in one case, without any effect. The writer just mentioned states that he has always been more or less unlucky with this remedy, which, in the ordinary mode of administration, shares all the defects of the other remedies for tape-worms, and easily produces sickness and violent pains in the intestines; and that the worm has generally been expelled by it in numerous fragments, and at most the worm up to the neck; but that he never found the head, excepting once, after a second dose of the koussu, which caused violent pain in the abdomen. Several attempts have been made in Germany to isolate the active constituents of this substance, and to prepare infusions, decoctions, and infuso-decoctions of it, with and without the flowers being retained in them; but, although the effect appeared to equal or to approach that of the powder of koussu itself, yet little was gained, excepting when the quantity (ʒvj.—ʒj.) of koussu usually employed was macerated in cold water for twenty-four hours, and then boiled for half an hour, and the whole taken—without straining—with the flowers in it, in two portions; ʒj. to ʒij. of castor oil having been given two hours after the second portion. This infuso-decoction was said to have been well borne, and to have acted with certainty.

187. *g.* NOTICES OF SEVERAL OTHER MEDICINES AND METHODS AGAINST TAPE-WORMS.—(a.) The *Spigelia anthelmintica* has been employed, according to NOVERRE, in the West Indies; but its effects are unpleasant, and it not easily admits of use in Europe.—(b.) *Sabadilla* has been given in a dose of half a drachm of the powder in the morning, the patient having been purged on the previous day with rhubarb and Glauber's salts. The sabadilla powder is given with the same quantity of fennel sugar, and the patient afterwards drinks one to two cups of chamomile or elder-flower tea. If vomiting be produced, worms in the stomach are thrown up. On the second day, the same dose of sabadilla is taken; and if no more of the worm appears, half the quantity of this medicine is taken morning and evening of the third and fourth days. On the fifth morning, whilst fasting, a purgative is administered, and the living or dead worm is brought away. For children from two to four years, two grains of sabadilla powder is a sufficient dose. This medicine is of service against *ascarides*.—(c.) The *sehébi*—the *Phytolacca dioica* or *Abyssinica*. The fruit of this plant has been tried in Europe, and fragments of the worm have been brought away; but sufficient trials have not been made of its efficacy.—(d.) The *fructus saoria*, the fruit of *Massa picta*, HOCHSTETTER, has been given in doses of ʒj.—ʒjss. with uncertain results. This remedy is easily taken. Its taste is less repulsive than that of other remedies. Nausea, vomiting, and slight pain in the abdomen are often experienced from it. In two cases, the worms were expelled by it up to the head, but always in fragments. This remedy appears to be deserving recommendation for *ascarides* and *oxyurides*.—(e.) The *Mucuna*—*cortex mucunæ*—from *Mucuna anthelmintica*. The dose of the powder is ʒvj., and is usually, in the East, given with honey in a stiff paste. Single fragments of the worm were brought away by it, but the medicine was probably injured by keeping.

188. *h.* DRASTIC PURGATIVES WITH AND WITHOUT CALOMEL.—BREMSER'S and SCHMIDT'S methods of employing these medicines are too severe, and are often productive of inflammation of the digestive mucous surface, which may not be allayed for some weeks. I will not, therefore, mention them. According to ETTMÜLLER'S plan, the patient takes, at seven o'clock in the evening, calomel. gr. xij., lapid. cancror. ʒj.; and about nine o'clock, olei amygdal. dulc. ʒjss.; which usually operate twice in the night. At seven and nine o'clock next morning, he takes cambogia gr. xij., rad. valerianæ, and sem. cinæ, aa., gr. iv., when the worm is afterwards expelled. I much doubt this result. It is quite unnecessary to state the various modes in which the changes are rung upon the purgatives believed to be most appropriate in cases of tape-worm, by writers of no mean reputation, and the several ways these medicines may be combined, and successively administered. Calomel, camboge, jalap, castor oil, the sulphates of potash, soda, magnesia, &c., variously conjoined or administered in succession, with or without valerian, oleum tancœti, &c., are the chief medicines advised. But, in order to be efficient, their doses, and the repetitions of them, are such as to risk the superintention of inflammation; and in a large proportion of cases they fail altogether.

189. *l.* INFERENCES. — (*a.*) Simple methods of treatment with the *filix mas* and its *athereal oil* and *extract* (§§ 176, 177.), are sufficient to remove the *Bothriocephali*. — (*b.*) For the expulsion of *Tænia solium*, the combination of the aqueous extract of the bark of the pomegranate root, with the addition of the *athereal extract* of male fern, is considered by KÜCHENMEISTER as the most efficacious, camboe, gr. iv.—vij., being preferable to the saline addition mentioned above. — (*c.*) The *Tænia mediocanellata* is generally expelled by the same combination, especially when a powder with calomel and jalap, or camboe, is given afterwards. — (*d.*) In very obstinate cases, the methods with tin, or those with turpentine, or with these latter following the former, may be employed with care and circumspection. — (*e.*) The kousoo does not promise any advantage over the above remedies, if, indeed, it be equal to any of them. — (*f.*) When the worms depend from the anus, the German physicians advise a cup of strong black coffee with plenty of sugar to be given immediately. A dose of calomel and jalap, or this followed by castor oil, appears to be more efficient.

190. *k.* TREATMENT WITH KAMALA (*the red powder obtained from the capsules of Rottlera tinctoria*, Roxburgh). — This substance, long known in India as a valuable dye for silk, has been much employed against tape-worm, which is very prevalent in the Punjab and North-western Provinces of India, and has recently been prescribed with success in this country by Dr. LEARED and others. This peculiar red powder may be prescribed in doses of half a drachm to three drachms suspended in water. "A single dose is often found sufficient, and in general it is not necessary to give any other medicine before or after. In some cases, however, where a small dose of kamala has been administered, castor oil has been afterwards given with good effect. Dr. GORDON has prescribed kamala in the dose of one drachm, repeated at intervals of three hours. Kamala may be given also in the form of tincture, the formula for which, recommended by Dr. ANDERSON, is as follows: —

No. 593. R Kamalæ, ʒvj.; — Spiritus rectificati, ʒxvj. Mæcra per biduum et cola.

An *athereal tincture* may be prepared of the same strength; but it is said to offer no particular advantage over the alcoholic. The dose of *tinctura kamalæ* is from ʒj. to ʒiv., diluted with some aromatic water." (Dr. HANBURY, in *Pharmaceutical Journ.* Feb. 1858, p. 405.)

191. Drs. C. MACKINNON, ANDERSON, CORBYN, and GORDON have praised the anthelmintic powers of this medicine. Dr. MACKINNON states, that the results have been so satisfactory, that he has continued to employ this whenever a case of tænia presented itself, and that he has given it in sixteen cases without a single failure. In none of his cases, excepting one, did he ever exceed, for a single dose, three drachms. This dose usually purges from five to seven times; and the worm is usually expelled dead in the fourth or fifth stool. In about half the cases, some degree of nausea and slight griping were experienced; in the remaining half, no inconvenience whatever was felt. Dr. MACKINNON states the following as the results of his experience of this medicine: — "1st, That kamala is a safe and efficient remedy for tape-

worm, and more certain than either turpentine or kousoo; — 2d, That, to a strong European, three drachms may be safely given as a dose; — 3d, That, to a person of feeble habit, or to a female, one drachm and a half, followed, if necessary, by half an ounce of castor oil, is a sufficient dose." Since the above was published, Dr. MACKINNON has administered this medicine to nearly fifty patients, and in two instances only was no worm expelled. (*Medical Times and Gazette*, Dec. 19. 1857, p. 628; and *Indian Annals of Med. Science*, vol. iii. p. 86.)

192. Dr. ANDERSON states that, "after three drachms of the powder (of kamala) have been administered, the worm is usually expelled in the third or fourth stool. It is generally passed entire, and almost always dead; and in all the cases I have examined (about fifteen), I was able to detect the head. In only two cases do I know of the worm being passed alive. The advantage of the tincture over the powder consists in its action being more certain and milder, and in its being rarely accompanied by nausea and griping. In two or three cases, only two or three stools followed the dose usually given, and the worm was expelled in the second stool; in one patient, only one stool was caused by the medicine, and in it the worm came away dead." (*Ind. Ann. of Med. Sc.* vol. iii. p. 82.) Dr. ANDERSON alludes to ninety-five cases of tape-worm, in which kamala was prescribed, and of this number (eighty-six were European soldiers) he was aware of only two in which no worm was expelled. Dr. C. A. GORDON remarks, that "with this medicine there is no unpleasant effect. It is not even necessary to take a dose of purging medicine as a preparative; and, beyond a trifling amount of nausea and griping in some instances, no unpleasant effects are experienced; while by far the greater number of persons to whom it is administered suffer no inconvenience whatever beyond what they would from a dose of ordinary purging medicine." (*Med. Times and Gaz.* May, 1857, p. 429.)

193. Dr. ANDERSON and Dr. GORDON agree in stating that the frequency of tænia in the North-west and Upper Provinces of India arises from the free use of animal food of a very unwholesome character by the European soldiers; whilst among the Hindu natives, whose food is entirely vegetable, this parasite is unknown. Foul-feeding and half-starved pigs, cattle and sheep, as well as ducks, turkeys, fowls, pigeons, equally foul-fed and diseased, are often made articles of diet by the European soldiers, and are justly viewed, by the physicians mentioned above, as the causes of the prevalence of tape-worm in this class.

194. *iii.* TREATMENT OF THE OTHER WORMS. — *A.* *Echinocoeci*, *cysticerci*, and *acephalocysts* rarely admit of treatment, and only of surgical treatment. This subject is sufficiently noticed in the article HYDATIDS.

195. *B.* The comparative rarity of the *Distoma hepaticum* (§§ 98—100.), and the difficulty of its diagnosis, render the prophylaxis and treatment of this worm, in some respects, matters of subordinate importance. The prevention is either difficult, or impossible, owing chiefly to our imperfect knowledge of its developmental history. As far as this history may be inferred from the subjoined remarks of KÜCHENMEISTER, the prophylaxis must be founded on it, and be

viewed as conformable with what has been stated above\* (§§ 157—160.). The direct treatment of *Distoma hepaticum* can rarely be ventured upon with success, owing, first, to the almost impossibility of its diagnosis, unless its presence be inferred from the passage upwards or downwards of some individuals of this species; and next, from the serious nature of the lesions produced by it. Even granting, then, the detection of the malady, medicines can be exhibited only with great uncertainty as to their beneficial effects. As, in many of these cases, the biliary functions are more or less interrupted, and organic vital force impaired, it becomes necessary to attempt the restoration of the former, and the development of the latter, by suitable means. To remove biliary obstruction, calomel and other mercurial preparations combined according to the peculiarities of the case; the nitro-muriatic acids internally and externally; the preparations of taraxacum, and the mineral waters of Carlsbad, Marienbad, Kissingen, and similar springs. DURAND'S medicine against gall-stones and obstruction of the gall-ducts has also been recommended. This medicine consists of equal quantities of oil of turpentine and sulphuric æther. It may be given in moderate and frequent doses; or the oil may be conjoined with alcohol, or with nitric æther, or with the sweet spirits of nitre. These appear to be appropriate for this parasite, as the efficacy of the turpentine against other worms, and the rapidity of the absorption of it into the circulation, are indications in favour of the use of it, in cases where the existence of this animal is inferred. KÜCHENMEISTER states that the principal ingredient of the remedy of DURAND has been successfully administered for *distoma* of some of the lower animals; and that, upon his recommendation, turpentine was administered to several sheep, and followed by a purgative; but the results were not fully ascertained when he wrote. The propriety of enabling the constitution to throw off the parasitic animal by the exhibition of tonics conjoined with alteratives and deobstruents, such as the bi-chloride of mercury with preparations of cinchona; the extract of taraxacum with the solution of potash, and with tonic and bitter infusions or decoctions; and the nitro-muriatic acids with these latter and with taraxacum, cannot be reasonably doubted.

196. C. *The Distoma hamatobium*, so remark-

\* "Although it is still unknown to us how the embryo becomes metamorphosed, and into what *cercaria-sacs* or *redia* it is converted, and where these *cercaria-sacs* or *redia* live; although we do not know whether the brood of *D. hepaticum* is tailed or tailless, and where it encysts itself, whether free in the water in the manner of *Monostomum*, in aquatic mollusca or insects, or in higher animals which occasionally visit stagnant waters—yet there is much probability that the herbivorous or omnivorous domestic mammalia infect themselves with free encysted young *Distoma*, either by devouring snails which adhere to the grass of the meadows, especially in moist pastures, or by drinking from impure, stagnant waters (marsh or pond water). Exactly the same thing would then take place in man, by means of snails adhering to salad, fallen fruits, radishes, turnips, and other roots. Nay, such small snails might even be introduced with dry fodder into the stomachs of our domestic animals during the winter, by their eating the small species, passing their winter sleep in their closed shells, or the shell-less slugs adhering to roots protected from frost in warm cavities or cellars. Whether the production of *D. hepaticum*, in the human liver, may take place by drinking impure water, must remain quite undecided. The finding of a young *Distomum*, in the sole of a woman's foot, appears to be in favour of an immigration, and a mode of existence similar to the *Cercariae*."—(*Op. cit.* p. 270, 1.)

ably prevalent in Egypt (§§ 103—109.), cannot be encountered with any means of prevention or of cure, upon which any reliance may be placed. GRIESINGER, who has furnished the chief amount of information respecting this parasite, considers that—1st, the waters of the Nile used without filtration;—2d, the bread, grain, and dates employed for food;—and 3d, the use of half-putrid fish; being the chief causes of its existence—the prevention of it must be based on the avoidance of these causes, and of the circumstances connected with them, which admit of avoidance. As regards the cure, calomel and turpentine are chiefly recommended by GRIESINGER, the latter being readily absorbed into the circulation, as first shown by me in a memoir on this remedy, published in the *London Medical and Physical Journal* for 1821. He also advises the use of onions, garlic, &c. The tinctura ferri muriatis, and other preparations of iron, of camphor, assafœtids, &c., variously combined, and long persisted in, may also prove of benefit, especially as anæmia and chlorosis form a marked characteristic of these cases.

197. D. *The Oxyuris vermicularis* (§§ 123—126.) is always treated with difficulty, and, according to my experience, with greater difficulty in old, than in young subjects. KÜCHENMEISTER states that internal remedies in general are but little to be recommended. I am of a very different opinion, based upon very considerable experience. This writer advises the long continued use of a tea made from the *flores verbasci*. The flowers are left in the infusion, and used with it. The fine hairs appear to irritate and disturb the worms mechanically. The remedies already noticed for the cure of tape-worm, especially turpentine, the pomegranate root, the filix mas, &c., often bring away the thread-worms, but they are soon regenerated. The permanent removal of them cannot be effected by these or by similar means. Medicines calculated to act upon the lower bowels, and to restore the tone of the digestive mucous surface, and to correct the state of the intestinal secretions and excretions, are especially required against these worms. Dr. POCHELLS recommends the powder of filix mas and jalap in some suitable vehicle; KÜCHENMEISTER, the preparations of the semen cinæ—the santonicum, or semen coats vermes—internally for two days, and afterwards strong purgatives, followed by clysters; DUJARDIN advises enemata with valerian, or garlic, or wormwood, with the addition of aloes; and many administer clysters of salt water, or a solution of salt in water with olive or castor oil. When the patient is distressed by these parasites during the night these or similar enemata should be administered at bedtime or shortly before. Numerous preparations of the santonicum, and various combinations of this seed with other substances, as the powder (ʒj.—ʒij.), the infusion, the decoction, the extract—in the form of electuary, mixture, confection, bolus, &c.,—with valerian, or jalap, or calomel, or aloes, or rhubarb, or sulphate of potash, or with sulphate of iron, or with alkaline carbonates, are contained in the Continental pharmacopœia, and employed against this and other species of worms.

198. The means which I have usually employed, for many years, against the *Oxyuris vermicularis*, with the view, not merely of removing

them, but also of preventing their regeneration, and of improving the functions of the bowels and the state of the general health, are, combinations of preparations of iron with those of aloes, taken internally for some days, or even weeks, according to their effects; and afterwards, enemata with olive or castor oil, spirit of turpentine, or assæfoetida, camphor, salt, &c., in gruel, according to the peculiarities of the case. The mist. ferri may thus be conjoined with the decoctum aloes compos., or with the tinct. aloes; or the pilula ferri comp., or sulph. ferri, may be given with the pilula aloes cum myrrha, the pilula galbani comp. and camphor. Electuaries may also be prescribed in other cases, with the carbonates or oxydes of iron, the santonicum, and confection of senna, with a small proportion of the confection of black pepper; and, if these do not completely remove the annoyance, the use of the enemata already recommended should be adopted (see FORM. 71, 80, 105, 106, 149, 151, and 153). In some cases where these are required, the long flexible tube should be introduced above the sigmoid flexure of the colon, so that the remedies may reach above this part of the bowel. Having removed the worms, it will be of service, in order to prevent their regeneration, to continue the use of the preparations of iron in conjunction with aperients and the other medicines which the circumstances of the case will suggest. The following pills have been found by me, for many years, to be most successful in removing and in preventing the regeneration of the *oryzidis vermicularis* and the *ascarides lumbricoides*, both of which parasites are present in the same case:—

No. 394. R. Ferri Sulphatis:—Quinæ Sulphatis:—Camphoræ, aa. gr. xvj.;—Pilulæ Galbani Comp. ℥ iiss.;—Pilulæ Aloës cum Myrrha, ℥ j.;—Pulv. Capsici, gr. xvj.;—Olei Cajuputi, ℥ xx.; Mucilag. Acaciæ, q. s. Misce, contunde bene, et divide in pilulas xxxvj., quarum capiat unam, duas, vel tres, bis terve in die.

The aloes, in combination with sulphate of quinæ, acts energetically on the bowels; therefore the dose of these pills should be regulated according to their operation; a larger dose being given for the expulsion of the different species of ascarides; and the smaller doses, for the prevention of their regeneration. The enemata already recommended should also be administered after the pills have been taken during two, three, or five days, the repeated exhibition of these latter rendering the former more efficient and generally successful.

199. E. *The Strongylus gigas* (§§ 128—130.). This worm, which is found chiefly in the kidneys and urinary bladder, can hardly be inferred to exist during life, unless its discharge takes place, which very rarely occurs. KÜCHENMEISTER remarks that, if several worms, or one large female, be present, the kidneys will be enlarged, so that the enlargement may be detected by palpation, percussion, and perhaps by inspection; but the cause of this swelling, or any flow of blood from the urinary passages, or of any existing retention of urine, could be referred to the presence of these worms only when any of them are passed from the bladder; and in this case, the treatment would be chiefly to alleviate irritation by mucilaginous and oily medicines, and emollients, demulcents, &c. The oil of turpentine, internally and externally, may probably be of use in some instances.

200. F. *The Ancylostomum duodenale* (§§ 132

—135.) is one of the infestations on Egypt and some other tropical countries, and to GRIESINGER we are indebted for all we know respecting it. Unacquainted at first with the real cause of the disease which it occasions—with the prevalent anæmia, chlorosis, &c., produced by it—he had prescribed iron, quinine, calcaria phosphorica (*phosphate of lime?*), &c., with much benefit in slight cases, but never with complete success in those which were severe. KÜCHENMEISTER states that, in one of his last dissections, a sudden light broke in upon him on this subject, when he found the duodenum, the jejunum, and even the upper half of the ileum, entirely filled with fresh, red blood, only coagulated here and there, and thousands of *Ancylostoma* on the mucous membrane of the small intestine, each with its little ecchymosis resembling the bite of a leech. Although he thus left Egypt, and could collect no further clinical observations, he told the Arabian prosector, "You must now employ calomel and other anthelmintics against these *Ancylostoma* and the *Distoma* of the portal vein, in short, against the tropical chlorosis, as well as against hæmaturia, stone, dysentery, abscess of the liver, and all the undetermined diseases of tropical countries, perhaps even some of the tropical fevers, and investigate the latter illness itself, with reference to the most recent helminthological discoveries." Above all things, GRIESINGER praises calomel and oil of turpentine *à priori*, the latter, indeed, especially for the *Distoma* of the portal vein, above all for the *Ancylostoma*, as it certainly reaches the worms situated in the uppermost parts of the intestine; in substance, worms die in it very readily, and it also acts as a styptic upon the injured, bleeding vessels. This last remedy when mixed with castor oil, or with castor oil and a few grains of santonine, or the *natron santonicum*, to which vegetable purgatives are added, must prove particularly efficacious. "None of our colleagues working in the tropics should forget that tropical chlorosis is the consequence of the repeated, small intestinal bleedings, which scarcely betray themselves externally, caused by intestinal worms, especially *Ancylostoma*."

201. G. *The Filaria Medinensis* (§§ 138—142.).

a. The prevention of this worm may be inferred from the causes and circumstances connected with its occurrence, namely, the endemic prevalence of filaria in certain climates and localities, its youngest brood living free in the water, or in wet grass, marshes, or moist soil, &c. Hence, wading through these places with naked feet, or exposing naked parts of the body to foul or impure water, should be avoided, as sources from whence the brood comes in contact with these parts, in the native countries of this worm. PRUNER states that an infection of the filaria may occur, as shown by numerous facts, even in those tropical regions in which the worm is not endemic, an actual transfer from one person to another, or to dogs and horses, taking place. BREMSER says that, even in his time, the worm had become naturalised in Curaçoa by the importation of negroes. No one, therefore, should use the same vessels employed by the patient in bathing, or washing the feet; and that great caution should be observed with the bandages of such patients.

202. b. *Curative Treatment*.—At the commencement of its growth, this worm is said, when ex-

ficial, to be easily killed by poultices of boiled garlic. When quite superficial, an incision is made upon it, and the worm pulled out with a hook. Slave-dealers rub in civet and musk on its first appearance. But the worm often produces no annoyance for a long time—six to eight months. When it inflames and ulcerates the integuments over its seat, the part of which appears is seized, and carefully pulled and fastened to a roll of linen or stick, and gradually extracted by turning these twice daily. Some writers advise, when the worm is felt, to cut down through the integuments, making an incision of several inches long, and removing the worm in a loop, or wedging into a piece of wood, and then pulling now on one side, and now on the other; the muscles being all the while relaxed. If inflammation, swelling, and pain are great, and the worm resists dragging, or break off, these symptoms are to be treated in the usual way, by poultices of linseed meal, or of onions and bread, or onions boiled in milk, or of roasted onions, &c. In these cases, numerous means have been recommended in addition, but none of them appear very appropriate or successful.

203. From the most ancient periods, the breaking of the worm has been considered a very serious accident; and severe inflammation, fever, gangrene, &c., have been, even by some modern writers, said to have resulted from it. According to the observations of most authors, who had themselves suffered from the breaking of the worms, violent swelling, inflammation, fever, sleeplessness had occurred, and were cured only when they were killed. The diagnosis, in cases of *Filaria Medinensis*, should always be correctly made, in order to determine the presence of this worm, and to distinguish between *FURUNCULI* (see that article) and inflammatory swellings caused by it.

204. *H. The Treatment of Ascaris lumbricoides* (§§ 144—149.).—*a.* For the prevention of this worm, it is necessary to bear in mind the circumstances in which the eggs may occur, and the long period during which they may be preserved. RICHTER ascertained that the eggs may remain in sewage and foul water for some time, and that they attain their full maturity, and undergo the process of segmentation in this situation. BARRY, BISCHOFF, and others have shown that alkalis and salts do not prevent this process. VERLOREN, that a period of eleven or twelve months is required for the completion of this process in the *Ascaris lumbricoides*. RICHTER and KÜCHENMEISTER state that eggs which had been put in water had not shown any appearance of embryos several months afterwards. As to what becomes of the ready-formed embryos, nothing is known positively; they probably get into our bodies with water, and perhaps this is sufficient for their development.

205. *b. The Cure of Ascaris lumbricoides.*—The number of medicines recommended with this object are so great that the judgment is distracted respecting them. In order to assist the selection, it has been attempted to determine the effects of the most reputed vermifuges upon living intestinal worms from recently killed domestic animals, by REDI, ANDRY, LECLERC, TORTI, ARNEMANN, CHABERT, and others. More lately, KÜCHENMEISTER has had recourse to similar experiments made in the temperature of the animal, by mixing the anthelmintic in white of egg, and placing the

living worm in the mixture; and has given us the following results, "arranged according to the time in which round-worms died in white of egg mixed with the various remedies:—

206. "1. Death took place in one to two hours in white of egg mixed with creosote, and large doses of common salt, and corrosive sublimate.

207. "2. Death took place in two to five hours in white of egg mixed with petroleum, cajuput oil, oil of turpentine, mustard, weaker solutions of common salt, and washed herring's milt.

208. "3. Death took place in five to fifteen hours in white of egg mixed with garlic, onions, laurel, cloves, wood vinegar, rad. pun. granati, tinct. gallarum, concentr. sol. of sulph. soda.

209. "4. Death took place in fifteen to twenty-four hours in white of egg mixed with camphor, anise, and infusions or decoctions of ginger, gentian, elm-bark, koussou, and hops.

210. "5. Death took place after twenty-four hours in white of egg mixed with infusion or decoction of parsley, rice, milfoil, tansy, valerian, chamomile, wormwood, myrrha, quassia, calamus, ipecacuanha, walnuts, china-bark, willow-bark, oak-bark, catechu, kino, assafoetida, gum ammoniac, Peruvian balsam, ol. ricini, aqua picis, creosote water," &c.

211. This writer states that besides the remedies here enumerated, he has tested the *semina cinæ* (*santonici*) with their preparations. In a mixture of white of egg with coarsely powdered seeds, the worms live for days; and in a mixture of white of egg with a strong infusion of *semin. cinæ*, with repeated additions of unboiled powder, they also lived for days. In a mixture of *santonine* with water and white of egg, the worms lived for days; and also in white of egg with *santonine* and a little vinegar. At the same time, however, the total insolubility of the *santonine* was proved by further experiments. In white of eggs mixed with castor oil and *santonine*, the worms died within an hour; but in this experiment the temperature was raised too high. In a mixture of white of egg with *natron santonicum* (*santonate of soda*) dissolved in water, *ascarides* lived more than twelve hours. These experiments form an introduction to the treatment advised for *Ascaris lumbricoides* by KÜCHENMEISTER, and more especially to the use of the preparations of *santonine*; but he previously notices the employment of the *semina santonici* by other helminthologists, who generally prescribed this remedy in the form of an electuary.

212. (*a.*) STORCK'S Formula:—

No. 395. R Pulv. Semin. Santonici (vel Cinæ), ʒij; — Rad. Valerianæ Min. Pulv. ʒj; — Rad. Jalapæ Pulv. ʒss; — Oxymellis Scill. q. s. ut fiat electuarium molle.

One teaspoonful every three hours.

213. (*b.*) SELLE'S Tonic Worm Electuary:—

No. 296. R Pulv. Seminum Cinæ, ʒvj; — Ferrisulph. Cryst. i; — Extr. Chinæ Fusc. ʒā, ʒʒ; — Syrupi Cinnam. q. s. ut fiat electuarium molle.

One tea-spoonful three times a day. This electuary is to be preferred some time after the expulsion of *Ascarides*, and to ascertain their permanent removal.

214. (*c.*) HUFELAND'S Worm Electuary:—

No. 397. R Pulv. Sem. Santonici, ʒss; — Pulv. Rad. Jalapæ, ʒj; — Kali Tartar. depur. ʒij; — Pulv. Rad.

Valerianæ, ʒss. ; — Oxytel. Scillæ, ʒvj. ; — Syrupi Simp. q. s. ut fiat electuarium molle.

One tea-spoonful every two or three hours.

215. (d.) CLARUS and other German physicians advised the *Semin. Santonici*, coarsely powdered, to be sprinkled over bread, and spreading syrup or honey over the powder, administering from ʒss. to ʒj. several times a day in this manner, followed every third or fourth day by a purgative.

216. (e.) BREMSER'S *Electuary* :—

No. 398. R. *Seminum Santonici* vel *Tanacetii Vulgaris ruditer contusorum*, ʒss. ; — Pulv. Rad. Valerianæ, ʒij. ; — Pulv. Rad. Jalapæ, ʒss. — ij. ; — Tart. Vitriol. (Potassæ Sulph.), ʒss. — ʒij. ; — Oxytel. Scillæ q. s. ut fiat electuarium molle.

A tea-spoonful to be taken two or three times a day. After taking two tea-spoonfuls daily, for three or four days, slime and worms pass off with more copious stools. If the worms are not expelled, BREMSER administers some more of the electuary twice or thrice. If the first pot of electuary be insufficient, a second is taken, but watery stools must not be produced. He never allowed more than two potfuls to be taken ; and he considered it unimportant whether worms passed or did not pass during its use. To relax the bowels once in the midst of this treatment he prescribed the following :—

No. 399. R. Pulv. Rad. Jalapæ, ʒj. ; — Pulv. Fol. Sennæ, ʒss. ; — Potassæ Sulph. ʒj. Misc. Fiat pulvis in partes ij. vel iv. æq. divid.

Half a powder to be taken every half, or every hour, or two hours, until it operates. For leucoplegmatic subjects he often gave CHABERT'S oil (composed chiefly of turpentine rendered still more nauseous) in doses of two tea-spoonfuls in water night and morning.

217. The *Semina Santonici*, KÜCHENMEISTER states, have been recently displaced by the preparations obtained from them, and in his opinion with justice. He extols chiefly two of them, viz. *Santonine* and the *Santonate of Soda* ; all the rest being unnecessary. He considers it to be preferable to administer *Santonine* with fatty oils, in order to bring it into solution as readily as possible ; and for this purpose he prefers to give it sprinkled upon bread and butter, or in the yolk of an egg with sugar ; and afterwards to follow it every three or four days with a gentle purgative (jalap or confection of senna), or to administer it in castor oil—gr. ij. to iv. of the *santonine* \* in ʒj. of the oil, to be taken in tea-spoonfuls until purgative action commences. In this way the remedy should be repeated, if possible, for some days, or every other day, so that soft stools, rather than actual purging, should be passed. Milk and butter-milk may be taken during this treatment. "Amongst the *santonine* lozenges, those prepared from cocoa, undepurified of oil, are most deserving praise." KÜCHENMEISTER remarks that the most troublesome effects of this remedy are spasms, obstructions, with tenesmus, and even bloody stools ; but that

\* The preparation of *santonine* is best effected by the employment of ammonia. It must be tasteless, when pure, because it does not dissolve in the mouth. Dissolved in alcohol, it is bitter. It is sparingly soluble in warm water ; but is readily in oils. It is inodorous, has a slight acid reaction, combines readily with alkalies, and becomes yellow in the light of the sun. When impure, it still contains resins and essential oils, and is consequently nauseous to the taste.—(CALLOND, in *Pharmac. Centralblatt*, 1849, p. 413. ; and J. CLARUS, in *Handbuch der Speciellen Arzneimittellehre*, 1852, p. 333.)

with a careful employment of the remedy (gr. ij. to iv. with ʒj. of castor oil) he has never seen ill effects produced by it, the administration of it with castor oil always preventing intestinal obstructions. The most annoying symptom, to the patient only, is the yellow or blue, or even green, appearance of objects, owing probably to the effect of this remedy on the nervous system ; but this appears to be only a temporary inconvenience, which soon disappears after the discontinuance of the remedy. This writer adds that "it follows, as a matter of course, to be cautious in the use of *santonine*, that he would never give more than eight grains of it in two days, divided into doses of two grains each twice a day, and that, on the second day of its use, he would administer an aperient."

218. (f.) *The Santonate of Soda*.—*Natron Santonicum* has recently been greatly praised by H. E. RICHTER and KÜCHENMEISTER, for its successful action in cases of *Ascaris lumbricoides*. The latter of these physicians states that he has never seen injurious effects from this medicine, even when administered in doses of eight to ten grains twice a day to adults. "The remedy to be given alone, as every acid decomposes it, and it must not be mixed in electuaries." He adopts nearly the following method :—He lets children (or adults) take a powder of *santonate of soda* with sugar (from two to six grains) on a Friday night, and he repeats the same dose on Saturday morning (fasting) and evening, and again on Sunday morning. On Sunday, half an hour or an hour after the last powder, an aperient electuary (confectio sennæ, &c.), or a sufficient dose of jalap, is taken, so that several soft motions may follow. By these means the worms usually pass off alive ; or they wander forth singly afterwards, and without stools, their residence having become disagreeable to them. Dr. PÖCKELS, who noticed a blackish discoloration of the tongue after *santonine*, praises, as a remedy for *Ascaris lumbricoides*, the root of *Aspidium filix mas* in conjunction with purgatives.

219. (g.) I have found no remedies more efficacious for the *Ascaris lumbricoides* than turpentine as prescribed above (§§ 183—185.) and in *Form.* 216, and the infusion of *spigelia* and *santonine*, as directed in *Form.* 264 in the APPENDIX. For this worm, also, as well as for the *Oxyuris vermicularis*, the preparations of the *semina santonici*, prescribed in the APPENDIX, will also be found successful. (See *Formula* 71, 80, 105, and 106.) These and other medicines will be frequently as successful without, as with, the preliminary treatment recommended by the German writers ; the exact operation of such treatment often being not very manifest. The great success derived from the powder and tincture of *kamala*, in India, in the treatment of tape-worms (see §§ 190—193.), and the effects of this substance upon these worms, promise similar results from it, if it were prescribed against the *Ascaris lumbricoides* and the *Oxyuris vermicularis*.

220. iv. AFTER-TREATMENT OF WORMS.—It is often requisite after the expulsion of intestinal worms has been effected—1st, To soothe the irritation, and to subdue the inflammatory action produced in the digestive mucous membrane by the vermifuges and drastic purges which had been prescribed. 2nd, To remove any stray worms which had become so sickened, or so injured by the treatment, as to be readily thrown off by themselves.

which would restore the vital tone of the bowels and further injure the worms, and render their residence disagreeable or untenable. And 3rd, To prevent the regeneration of these parasites by removing their ova and rendering the digestive mucous surface ungenial to their development. (a.) The first of these intentions is best accomplished by emollients and demulcents with small doses of nitrate of potash, of hydrocyanic acid, and syrup of poppies, &c. When sickness is troublesome, and no inflammatory action is present, a pill with half a drop of creosote, may be given with each dose of the above, or may be taken in the intervals between each. The diet should be spare, light, and digestible, and the bowels assisted by gentle laxatives, such as magnesia, with or without confection of senna, and by suitable enemata, especially by such as contain castor or olive oil, with oil of turpentine when the irritation is chiefly experienced in the stomach and upper portions of the intestinal canal; at the same time, the warm bath, or terebinthinate embrocations, or a recourse to these latter upon leaving the bath, will be found of much service. The drink of the patient should be demulcent, and in small quantity; thirst in these cases being most relieved by sucking small morsels of ice.

221. (b.) The second intention presupposes either the non-existence or the removal of those conditions against which the first intention was directed, and consists in the occasional exhibition of a moderate or less irritating dose or doses of the anthelmintic suitable to the expulsion of the worm found to be present, and the combination of it with such other means as the peculiar features of the case will suggest; a recourse to vermifuge clysters, especially to those already suggested, or those advised above (§ 194.), being had after the internal remedies had been taken.

222. (c.) The third intention is of no small importance if the permanent cure of the patient be considered. For the original conformation, or the depression of vital power, of the patient; or the irritability and exhaustion of the digestive canal, may be so great in consequence both of the existence of these parasites and of the means taken to expel them, that a tonic and restorative treatment becomes imperative in order to prevent various unpleasant contingencies. Besides, in many instances, anæmia has become so considerable as to require a treatment directed more or less to it, and to the other morbid tendencies. In these circumstances not only should due care be directed to the prevention of intestinal worms, but recourse should be had to those medicines which are calculated to restore the vital tone of the digestive organs, to improve the state of the secretions and excretions of the body generally, but of the intestines in particular, to promote the functions and actions of the bowels, and to render the human intestinal canal an unsuitable and an uncongenial habitation for the ova of worms and for their development. These are objects which should always be entertained after the expulsion of worms of whatever species, and should be attempted by such means as are most likely to accomplish them. It may be asked, however, where are we to find, how are we to combine these means, and how are we to prevail on the patient to persevere in their use, or even to have recourse to them when he believes himself free from his enemy? I cannot say

that there are no other means calculated to attain these objects, but I may enumerate\* those which I have employed with these views, combining them variously, and exhibiting them in such successions, intervals, &c., and as the circumstances of particular cases appeared to require. The medicines which I have thus employed are the preparations of iron, assafoetida, of cinchona and quina, of myrrh, camphor, aloes, infusions of willow, cascarrilla, and cedar bark, berberine, &c. The compound mixture of iron may be given with the decoction or tincture of aloes, &c.; or the sulphate of iron may be prescribed with sulphate of quina, compound galbanum pill, and with the aloes and myrrh pill. Camphor may be conjoined with these latter substances (§ 198.) singly or in the combination now stated. The sulphate of quina may be given with dilute sulphuric acid, and sulphuric æther. The infusions of the barks may be taken with tonic and laxative tinctures, or with the mineral acids, &c., and laxative electuaries may be conjoined with sulphur, or antispasmodics, aromatics, or spices.

223. It is obvious that the diet of patients who have suffered from worms should be nutritious, digestible, and restorative; whilst it ought not to be too rich or full, or calculated to produce general plethora or local congestions, as of the liver, &c. The regimen ought to be regulated so that sufficient exercise may be taken in the open air, and that all causes of debility and exhaustion should be avoided. The remarks already offered for the prevention of the human entozoa (§ 157. et seq.) are equally necessary to the prevention of their return after their expulsion.

\* I may here state that the pharmacopœia of the United Kingdoms are very deficient in vermifuge remedies, and in formulae for the preparation and combination of them — a remark by no means applicable to the pharmacopœia of most continental countries. But verminous diseases are much more prevalent on the Continent than in the British Isles, in which, however, I am confident that their prevalence has hitherto been much underrated, and their importance undervalued. The very general and noxious vice of smoking tobacco, and of otherwise using this poison — so much extended in recent times — has rendered, and will still more render, verminous diseases more prevalent, by weakening the digestive organs, and disposing them to the generation and development of the ova of worms.

YAWS. See VENEREAL DISEASES (§ 85, et seq.).

ZYMOTIC DISEASES.—*Ζυμωτικές*, causing to ferment.—*ζύμωσις*, a fermentation—*ἥπατος ζύμωσις*, a swelling of the liver, *ἩΠΟΚΡΑΤΗΣ*.

The term *Zymotic* has recently been applied by Dr. FARR to *epidemic, endemic, infectious, and contagious diseases*, and has comprised small-pox, measles, scarlatina, hooping-cough, croup, thrush, diarrhoea, dysentery, cholera, influenza, ague, remittent fever, typhus, erysipelas, syphilis, hydrophobia. Viewing the Greek term to mean a *leaven* by which the organic nervous system, or the vascular system and blood, may be infected or contaminated, either successively, or contemporaneously, or nearly so, the term well designates an extensive class of diseases, although its application implies an hypothesis: but it is well suited to the arrangement adopted by Dr. FARR in his admirable *Annual Reports of Deaths, &c., in England* (which see).

---

## SUPPLEMENT.

**SUPRA-RENAL BODIES.**—**SYNON:**—*Glandula ad Plexum, Glandula ad Plexum Nervium*, T. WHARTON; *Glandula supra-renales, Renes Succenturiati*, Auct.; *Supra-renal glands, Supra-renal capsules, &c.*

1. I. **STRUCTURE AND FUNCTIONS.**—In the present state of our knowledge the name "*supra-renal bodies*," or that adopted by WHARTON, appears more correct than *supra-renal glands*, the functions of glands not having been proved in respect of them; and the term, *capsules*, is equally inapplicable, even to their more external structure. *Succenturiati*, or reserved kidneys or bodies, are not less appropriate. The earliest notice of the connections and nature of these bodies appear to have been taken by WHARTON, who pointed out their relations to the ganglial nerves, as remarked by Dr. GULL. Nevertheless the functions and diseases of these bodies received no attention from physiologists and pathologists (although in several instances, organic lesions observed in them had been published in the *Ephemerides Naturæ Curiosorum*, and more recently by VETTER and BAILLIE), until very lately, when the structure and functions of these bodies were remarked upon by NAGEL, BERGMANN, ECKER, KÖLLIKER, LEYDIG, and GREY; and their diseases, especially in connection with a bronzed discoloration of the skin, were first investigated by Dr. ADDISON, and subsequently by Mr. HUTCHINSON and others. It is chiefly, however, to Dr. ADDISON that the distinction of having first directed attention to these lesions is due. Although several cases have been recently observed and recorded — not always, however, with due care and precision — still the number of those in which a bronzed state of skin appeared more or less intimately connected with, and most probably caused by, disease of these bodies, is so great as to induce a presumption that where the former appearance exists the latter lesion will be found. In order, however, to form correct views as to the phenomena by which diseases of the supra-bodies are indicated, as well as to the nature and consequences of such disease, it becomes requisite that we should previously briefly inquire into what is known of the structure and functions of these bodies. Unfortunately opinions on these topics have been, and, notwithstanding the frequency of microscopic research in modern times respecting them, still continues to be, very unsatisfactory. Dr. WHARTON, about the middle of the seventeenth

century first noticed their connections with the ganglia of the solar plexus, and suggested a name for them, which appears more appropriate than any other which has more recently been given them.

2. i. **STRUCTURE.**—KÖLLIKER has very recently described the microscopic appearances of these bodies, and noticed what appears to be their functions, and Dr. HARLEY has still more recently examined their structure.—A. The *cortical structure* of these bodies is described by the latter observer, as consisting of cells, arranged in irregularly-sized rows, in a fibro-areolar matrix, the rows of cells appearing like a number of dark yellow columns placed perpendicularly to the surface. The cells, when examined individually, seem to be composed of a homogeneous cell-wall, filled with granules, pigment, and some fat globules. Each cell has a well-marked nucleus, although not always visible. The cells are arranged in a number of larger and smaller masses, which are placed in regular rows, and thus give rise to the columnar appearance. In some cases, a column is composed of several cell-masses of different lengths, placed end to end; in others it consists almost entirely of one long cell-mass. Each column, as well as each cell-mass, is separated from the others by delicate fibrous tissue, in which are included the vessels and nerves. Sometimes the cell-masses present the appearance of long tubes, enclosing a single straight row of quadrilateral cells. Each cell-mass is closed at the extremities, and is surrounded by a delicate homogeneous membrane.

3. B. The *medullary substance*, according to KÖLLIKER, also has a *stroma* of connective tissue, which, prolonged from the cortical lamellæ, pervades the whole interior, for the most part, in more delicate fasciuli, constituting a net-work with narrow, rounded meshes. In this network lies a pale, fine-granular substance in which, in man, and in recent preparations, pale cells of 0.008—0.16" are generally observed. These pale cells occasionally present, in their fine-granular contents, a few fat, or pigment granules; their frequently very distinct *nucleus* with large *nucleoli*, their angular form, and occasionally their *single* or *multiple*, or even branched processes, resembling the nerve-cells of the central organs, although they cannot definitively be declared to be such. Dr. HARLEY states that the dark slate-coloured medullary substance is composed of a network of fibres, in the meshes of which are a number of large nucleated cells, which

have been described by various writers as ganglion corpuscles; but he thinks that these, like the cells in the cortical substance, are true secreting cells. This great difference of opinion (so frequently observed amongst microscopists) — the same nucleated cells being considered as ganglial corpuscles by some observers, and as true secreting cells by others — prevents in the present state of our knowledge much reliance to be placed upon the results of microscopic researches, each successive observer being liable to the distrust which attaches itself to his predecessors. However the following is less liable to objection:—

4. C. The nerves of the supra-renal bodies are, according to BERGMANN and KÖLLIKER, extremely numerous; arising, according to them, from the semilunar ganglion and renal plexus, and to a small extent from the vagus and phrenic nerves; but most probably intercommunicating with, rather than arising from, the latter. In man, KÖLLIKER counted in the right supra-renal body thirty-three trunks, eight of which were  $\frac{1}{10}$ — $\frac{1}{10}$  five of  $\frac{1}{30}$ — $\frac{1}{30}$ ; seven of  $\frac{1}{25}$ — $\frac{1}{31}$ ; and thirteen of  $\frac{1}{45}$ — $\frac{1}{50}$ ; and found that without exception, or at all events in a very preponderating proportion, they were constituted of dark-bordered, finer and medium-sized, or even thick fibres; were whitish or white, and furnished with isolated larger or smaller ganglia. They are especially apparent on the inferior half and inner border of the organ, and appear to be all destined for the medullary substance, in which, at least in the Mammalia, an extremely rich plexus of dark-bordered, finer fibres occurs, inclosed in the trabecule and connective tissue, their terminations, however, being nowhere perceptible.

5. ii. FUNCTIONS.—As regards the functions of the supra-renal glands, in the absence of all physiological indications, and so long as the course of the nerves in them is not more accurately known than at present, only very general observations can be offered. KÖLLIKER considers the cortical and medullary substances as physiologically distinct, and that the former may, provisionally, be placed with the so-termed "blood-vascular glands," and a relation to secretion assigned to it; whilst the latter, on account of its extremely abundant supply of nerves, must be regarded as an apparatus appertaining to the nervous system, in which the cellular elements and the nervous plexus either exert the same reciprocal action as they do in the grey nerve-substance, or stand in a relation as yet wholly unascertained towards each other.

6. According to LEYDIG, the cortical substance of the supra-renal capsules of the Mammalia corresponds to the yellow, granular, and striped supra-renal bodies of fishes and amphibia; whilst the medullary substance of the mammalian organ, which is abundantly supplied with nerves and cells, very like the ganglion-globules, represents the other divisions of the sympathetic ganglia: whence he concludes that BERGMANN'S view, according to which the supra-renal capsules are closely related to the nervous system, is undoubtedly correct, and that those organs bear the same relation to the ganglia of the sympathetic nerves, as the pituitary body bears towards the brain. Besides this relation to the nervous system, however, they have an intimate one with the vascular; and are, therefore, always pervaded by a very close capillary plexus.

7. The functions of the supra-renal bodies have

been experimentally investigated by BROWN-SEQUARD, HARLEY, and others, but with different results. We know how uncertain these results are in the lower animals, and the amount of confidence which may be reposed in them, not only in those which were so frequently performed thirty and forty years since in order to determine the functions of distinct portions of the nervous system, but also in those more recently made with these and with other views. The former of the experimenters just named removed the supra-renal bodies from fifty-one rabbits, eleven adult cats and dogs, eleven young dogs and cats, eleven adult Guinea-pigs, four young Guinea-pigs, and two mice; and he states that the adult animals operated on died, on an average, in twelve hours, while the young or new-born animals lived thirty hours. From these experiments Dr. BROWN-SEQUARD concludes that the supra-renal bodies are more necessary to life than even the kidneys; for animals will live two, or even three days, after the removal of the latter organs. Dr. HARLEY quotes from a later publication of Dr. BROWN, in which the latter states that, of ten rabbits from which he extirpated the supra-renal capsules, six died, between the seventh and tenth hour, and four between the tenth and fourteenth hour after the operation, and adds, that the animals died too quickly to admit of their death being the result of peritonitis; and further, that the extirpation of these capsules is followed by symptoms which do not occur after injuries of the peritoneum or liver, &c., these symptoms indicating that the supra-renal bodies have an important influence on the blood, and that their nerves have a singular power upon certain parts of the central nervous system. He states that this latter influence manifests itself very distinctly in some cases after the extirpation or the puncture of one of these bodies, the animals being sometimes seized a few minutes before death by vertigo and rolling over. Dr. BROWN-SEQUARD concludes, first, "that if these organs are not essential to life, they are at least of very great importance. Secondly, that their functions appear to be at least as important as that of the kidneys, for when they are absent, death in general supervenes more rapidly than after the removal of the kidneys." (*Archives Génér.* 1857, p. 374.)

8. Dr. HARLEY has published experiments which furnish different results from those now stated; and from those he infers, that "the supra-renal capsules are not absolutely essential to life;" that "the removal of the right, is generally more fatal than the removal of the left capsule;" that "convulsions do not necessarily follow the removal of the capsules;" that, "when death follows upon the extirpation of the supra-renal bodies, it is in most cases in consequence of the injury done to the neighbouring tissues; perhaps more frequently the mutilation of the ganglionic system of nerves;" that "absence of the function of the supra-renal bodies is not proved to have any special effect in arresting the transformation of hæmatin, or in increasing the formation of blood-crystals;" and that the suppression of the functions of these bodies is not attended by an increased deposit of pigment in the skin, or its appendages, in certain of the lower animals; the problem of the connection of bronzed skin and supra-renal capsular disease, being more likely to be solved in the dead-house than in the physiological laboratory.

9. Viewing the structure and connections of the supra-renal bodies as altogether similar to those of the pituitary gland, and considering these organs as very intimately connected, anatomically and functionally, with the ganglia and ganglial plexuses, I have been induced to view them as organs contributing or subsidiary to the organic nervous force or influence exerted by the ganglial nervous system. Thirty-four years ago I published this opinion of the function of the pituitary gland in my *Physiological Notes*, &c. (in 1824), and stated, that this gland reinforced the ganglial nervous influence endowing the brain by means of the ganglial nerves distributed to the cerebral organs—that it was a portion of the ganglial nervous system contributing to the nourishment and functions of the brain, and imparting an unity of development, of permanent nutrition and of function, to the double organs composing the cerebral mass. It appears very probable that similar offices are performed by the supra-renal bodies as regards the ganglia and ganglial plexuses of the abdomen; these bodies contributing to the functions of the organic nervous or ganglial system, as displayed by the abdominal organs—whether digestive, assimilative, or generative. That both the pituitary body and the supra-renal bodies perform these important functions—important not only as respects the performance of their respective functions, but also as regards the life of the individual—appears to be manifest from the nature and character of the nervous communications existing between them and other parts of the ganglial nervous system; for, instead of describing these communications merely as branches of nerves detached from other ganglia or parts, it would be more correct, taking the size and appearance of these branches into consideration, to describe them as branches sent from the medullary structure of these bodies, to those ganglia, plexuses, and nervous trunks, in order to convey to these the special influences or functions of these bodies; or, otherwise, to reinforce and combine the influence exerted by these several ganglia and parts, with which they are anatomically connected. That these bodies are of the greatest vital as well as functional importance is evinced not only by the consequences following their structural lesions, and by the presumed nature of their functions, but also by the manner and the positions of their lodgements; both the pituitary and the supra-renal bodies being so located as to render them, in their respective situations, further removed, and better protected from injury, and even from structural or other disease, than any other part of the animal organisation.

10. II. STRUCTURAL DISEASE OF THE SUPRA-RENAL BODIES.—*Lesions of the Supra-renal Bodies, and their Associations, &c.*

CLASSIF.—IV. CLASS. I. ORDER (See Preface, &c.).

11. DEFINIT.—*General languor and debility, anæmia, feebleness of the heart's action, remarkable irritability of the stomach, frequent vomiting, and pain in the back and loins, often with a bronzed or dusky hue of the general surface, rapidly increasing exhaustion, emaciation, &c.*

12. Disease of the supra-renal bodies usually commences so gradually as not to admit of the patient's knowledge of the exact period at which he first began to experience loss of health or strength. It is almost always gradual in its early

progress, although often rapid in its more advanced course. The slowness or rapidity of its progress must, in the present state of our knowledge, be attributed to the nature and extent of the organic lesion, to the circumstance of one or both bodies being affected, and to the nature and severity, local or constitutional, of the malady with which structural change of these bodies is complicated.

13. i. *Symptoms*.—Generally the patient at first complains of weakness or more marked debility, of languor, and of indisposition to bodily and mental exertion. The appetite is impaired or lost; the pulse is soft, weak, and often frequent; the whites of the eyes are pearly; the body is sometimes more or less emaciated, or, if not emaciated, leuco-pneumatic or cachectic, or discoloured, and generally anæmied. Uneasiness or pain, often severe, is referred to the region of the stomach, epigastrium, back, or loins. Nausea, sickness, retchings, and frequent vomitings often occur, especially as the prostration, anæmia, and discoloration of the skin advance. In some cases, complicated with disease of other organs, especially when such disease is acute or disorganising, the discoloration may either be absent or overlooked. In other cases, it is slight, or in patches, consisting of a murky hue; but, in others, it amounts to a bronzed tint, and is general over the whole surface, but is commonly most marked on the face, neck, superior extremities, penis, and scrotum, in the flexures of the axillæ and limbs, about the umbilicus, &c., varying in deepness from a dingy or smoky appearance to a chestnut-brown, or colour of a mulatto. In some cases, patches of a lighter hue occur in various parts; and in many the discoloration may be remarked in some of the internal surfaces, the peritoneum, pleura, &c.

14. With the continuance and progress of disease, the languor, anæmia, loss of appetite, and feebleness of the heart's action are aggravated. The discoloration of skin becomes in some cases more marked, the commissures of the lips much darker, the pulse smaller and weaker, vomiting more frequent and urgent, and pain and weakness of the back and loins more complained of. At last the patient sinks and expires, after a period which is very indefinite, so that the disease may appear almost acute in some instances, and more or less chronic in others, most probably owing either to the severity of the disorganising lesions affecting the supra-renal bodies, or to the nature of the complications characterising particular cases.

15. Although lesions of these bodies are often uncomplicated with disease of any other organ—although no lesion or disorder of any important or vital part can be detected, in many cases, during the life of the patient, lesions of these bodies, and a peculiar anæmia, being the only or chief lesions found after death, very frequently accompanied with discoloration—yet they are often associated with other diseases, chiefly of a constitutional and cachectic nature, more especially with general or partial tuberculosis, with cancer, and with disease of the lungs, &c.

16. The following table of cases of disease of the *Supra-renal Bodies* comprises nearly all those which have been published up to this time. It is constructed according to that published by Mr. HUTCHINSON; and to it I have added some recent cases.

No.	REFERENCES.	SEX AND AGE.	OCCUPATION.	PREVIOUS HEALTH, &c.	EARLY SYMPTOMS.	BROWNING OF SKIN—IN DEGREE OR AMPLE.
1.	Dr. Addison's Work, p. 9.	Male, 32	Baker - -	No history. Skin white when in health.	Cough, followed by debility and bronzing of skin.	Colour of Mucosæ; æstium and penis darkened.
2.	<i>Ibid.</i> p. 12.	Male, 35	Tidewaiter. Married. Exposed to weather.	Rheumatism eight years previously. Health generally good.	Acute attack of fever, followed by debility and bronzing of skin.	Dark olive-brown; also lining of lips.
3.	<i>Ibid.</i> p. 15.	Male, 26	Carpenter. Married. Intemperate.	Very good until three months before the change of colour.	Pain in the back and right leg, followed by debility, wasting, and giddiness.	Dark olive-brown, appeared in patches.
4.	<i>Ibid.</i> p. 19.	Male, 22	Stonemason -	No history. Died soon after admission.	Pain in stomach; vomiting; the douloureux.	Face, axillæ, and hands of bronzed colour.
5.	<i>Ibid.</i> p. 23. (From Dr. Bright's Reports.)	Female, adult.	Not stated -	No history -	No history - - -	Complexion very dark -
6.	<i>Ibid.</i> p. 25.	Male -	Barrister. Of middle age.	No history -	No history - - -	Surface generally dark; face, neck, and arms covered with dry brown patches.
7.	<i>Ibid.</i> p. 30.	Female, 60	Not stated -	No history. Cancer of supra-renal bodies; consecutive of cancer of breast.	Cancer of breast - -	Skin of arms, chest, and face of a light brown colour.
8.	<i>Ibid.</i> p. 32.	Female, 53	A servant. Single.	Always thin; but of good health.	Cutaneous eruption four months previously; its cure being followed by stomach symptoms.	Skin generally very dark, with darker patches.
9.	<i>Ibid.</i> p. 35.	Male, 53	Sailor. Married. Sober.	Very good. A strong muscular man.	Two months previously began to lose appetite and be generally unwell.	Face of a yellow bronzed tint, becoming still darker.
10.	<i>Ibid.</i> p. 37.	Female, 28	Not stated -	Died of cancer uteri. Disease of supra-renal bodies being consecutive.	Those of cancer uteri -	A peculiar dingy appearance.
11.	<i>Ibid.</i> p. 39.	Male, adult	Not stated -	Died of cancer of lungs, &c.	Those of cancer of the thorax.	Face of a dingy hue, with freckles and brown discoloured spots.
12.	Med. Times and Gaz., Dec. 15, 1855. (Dr. Burrows.)	Male, 24	Hawker, Single.	Had lumbar abscess in childhood.	Pain in the back, followed by emaciation and bronzing.	A dark copper or brown colour generally, and lighter patches.
13.	<i>Ibid.</i> Jan. 19, 1856. (Dr. Gull.)	Male, 24	Carpenter. Temperate.	Robust - -	Debility; breathlessness on exertion; nausea, &c.	Skin of a sallow dirty-brown, darker on inside of lips, knees, &c.
14.	<i>Ibid.</i> Jan. 19, 1856. (Mr. Bakewell.)	Male, 28	Labourer -	Not known -	Not known - - -	Skin generally dark brown or bronzed, and darker over the thighs.
15.	<i>Ibid.</i> Feb. 23, 1856. (Dr. Thompson, &c.)	Male, 20	Baker. Sober	Good - -	Bronzing of skin - -	Skin of a general peculiar dark dirty-brown colour.
16.	<i>Ibid.</i> Feb. 28, 1856. (Dr. Rowe.)	Male, 20	Not stated -	Delicate - -	Delicate health and bronzing of skin.	Skin generally brown, with darker spots.
17.	<i>Ibid.</i> Mar. 8, 1856. (Dr. Farré.)	Male, 37	A publican. Intemperate.	A year before had pain in the lumbar regions, which subsided.	Admitted for delirium tremens.	Skin generally of a general yellowish brown.
18.	Dr. Addison's Work, p. 29.	Male, 69	Not stated -	No history -	No details - - -	Generally dark and bronzed, with blotched patches.
19.	Med. Times and Gaz., p. 223. (Dr. Stocker.)	Male, 56	Physician -	Dyspeptic, but not otherwise ill.	General malaise and irritability of stomach; increasing debility and emaciation.	Patches of brown colour, which extended to small patches on the face.

GENERAL SYMPTOMS, COMPLICATIONS, &c.	DURATION OF DISEASE.	MODE OF DEATH.	INSPECTION AFTER DEATH.	REMARKS.
ve debility; emaciation; sour puerile; urine healthy; a lumbar region; cough; at the epigastrium.	3 years -	Acute pericarditis and pneumonia.	Supra-renal bodies both remarkably indurated and as large as eggs, and quite disorganised; recent pericarditis and pneumonia; no tubercles, nor other visceral disease.	A well-marked case. No chronic lesions but those of supra-renal bodies.
l anxious expression; voice; pulse very feeble; depression; tenderness at firm; numbness of ex-	6 months	Not stated -	Both supra-renal bodies contained compact fibrous concretions; gastric mucous surface inflamed; no tubercles; no other visceral disease.	The deposits in supra-renal bodies resembled tubercle, but there was no tubercle in other organs.
ale, and feeble; fainting on from bed; sickness and pain in back; ang. cor- of spine; leucocythmia,	7 months	Passed into a torpid state.	Supra-renal bodies completely destroyed and converted into strumous deposits; psoas abscess, and caries of lumbar vertebra; tubercles in lungs; spleen enlarged.	The blood, both before and after death, contained a great excess of white corpuscles.
ng and pain in stomach; debility; emaciation; ex-prostration, &c.	Several months.	From collapse and sinking.	Supra-renal bodies wasted and destroyed, both weighing only 49 grains. No other disease.	The disease of supra-renal bodies was an atrophy; probably consequent on inflammation.
ie debility; vomitings; stion; abscess in breast.	Not stated	Slight wandering, gradual sinking and drowsiness.	Both supra renal bodies were enlarged, lobulated, and the seat of tubercular-like deposits, both four times the natural size; the left had suppurated.	This case was recorded by Dr. Bright before the importance of dissection of supra-renal bodies was recognised.
maciation; great anæmia; se languor; urgent vomit- pulse very compressible.	1 year -	Speedy sinking -	Both supra-renal bodies greatly enlarged, of irregular surface, and much indurated; natural structure lost; nucleated cells. No other important disease.	Vomiting had been so urgent in this case as to suggest the existence of malignant disease of the stomach.
story. Died of ulcerated, the bronzing being red at the post-mortem in-	Not stated	Not stated -	Both supra-renal bodies contained much cancerous deposit; through-out their structure.	
sted and feeble; much irri- y of stomach.	4 months	Died of exhaustion in three days after admission.	Cancer of pylorus; left supra-renal body destroyed by cancer.	The extent of discoloration of skin was proportioned to that of disease of supra-renal body, one being sound.
se, without vomiting; weak- loss of appetite; frequent; no pain; pulse 80, feeble; irritable.	3 months	Sunk gradually -	Tubercular deposit in one supra-renal body; in the spleen also; and the kidneys were degenerate.	The degree of bronzing appears to have been proportioned to that of disease of supra-renal body, one only being affected.
oration of skin not noticed the post-mortem inspection, disease of supra-renal body retarded. No history pre-	Not stated	Died from cancer -	Right supra-renal body healthy; the vein emerging from the left obstructed by cancerous deposit; and the organ itself occupied by recent extravasation of blood.	The degree of bronzing was slight; the disease of one supra-renal body being recent.
tory preserved -	Not stated	Died of cancer -	One supra-renal body entirely disorganised by cancer; the other healthy.	One supra-renal body was affected, and the bronzing was slight.
ility of stomach, with vo- g; pain across the back; debility; emaciation; urine al, &c.	8 months	Died from exhaustion consequent upon a purgative.	Both supra-renal bodies contained pus and bodies resembling hardened tubercle. There was no other disease.	The chain of morbid phenomena was very complete in this case.
a; vomiting; great malaise; stion; emaciation; urine ty; blood loaded with white scales.	3 months	Sudden exhaustion	Both supra-renal bodies atrophied and destroyed; the left contained cysts, the right solid concretions.	
and low for a long time; uch emaciation.	Unknown	From exhaustion caused by a short journey.	Both supra-renal bodies completely atrophied, and contained calcareous concretions; emphysema of lungs; fatty degeneration of heart.	
nly languid, and afterwards sed, and died after three; tint of skin observed for eeks.	6 weeks -	Collapce -	Each supra-renal body enlarged to the size of half a kidney; their structure converted into a firm tubercular-like matter, and in parts softened.	This appears to have been idiopathic disease of supra-renal bodies, no tubercles being found in other organs.
also disease of knee-joint, seath rather improved until n three days of death. He died fat and muscular,	8 months	Diarrhoea, followed by succession of epileptic fits, vomitings, &c.; died on fourth day of these.	Both supra-renal bodies destroyed, containing grity, cheesy, and semi-purulent deposit. No other disease.	In this, as in case 23, a peculiar disagreeable odour exhaled from the patient for three or four weeks before death.
ed in a fortnight from deli- tremens.	3 weeks or more.	Sunk into a typhoid state, with low delirium.	Both supra-renal bodies were converted into abscesses, but their cortical substance was not wholly destroyed; circumscribed abscess in the liver.	In this case the suppuration and inflammation of supra-renal bodies had probably been acute and recent.
tic; heart's action very fee- rritability of stomach; ede- f upper extremities.	Not stated	Died of debility; cancer in mediastinum suspected.	No inspection - - -	The cachexia was precisely that of diseased supra-renal bodies.
debility and wasting; but no e disease but that of supra- bodies indicated.	About 6 months.	From exhaustion -	No inspection - - -	The bronzed patches indicated the patient's speedy death when there were not other alarming symptoms.

No.	REFERENCES.	SEX AND AGE.	OCCUPATION.	PREVIOUS HEALTH, &c.	EARLY SYMPTOMS.	BRONZING OF SKIN.—IN DISKASE OR ANEMIA.
20.	<i>Ibid.</i> Dec. 15. 1855. (Mr. Startin.)	Male, 12	At school. (Irish.)	Had suffered from abscesses in the neck, and cough.	Loss of appetite, flesh; increasing languor and debility.	Copper-colour general, and deepest on the face and neck.
21.	<i>Ibid.</i> Dec. 29. 1855. (Dr. Peacock.)	Female, 14	At school	Healthy	Lassitude; muddy complexion; and slight cough.	A brown muddy tint, deepest on face, arms, and shoulders; no swelling.
22.	<i>Ibid.</i> Jan. 13. 1856. (Dr. Burrows.)	Female, 28	Married. Temperate.	Delicate	Menorrhagia and debility two years before the discolouration.	A fawny or yellowish-brown tint; most marked on face, arms, thighs and legs; patchy discoloration in parts.
23.	<i>Ibid.</i> Feb. 23. 1856. (Dr. Rowe.)	Male, 45	A carter. Married. Temperate.	Robust	Dark spots in various regions of body. At first no illness.	Skin dusky-brown, resembling that of a mulatto; darker in some parts than in others.
24.	The Assoc. Jour. Jan. 19. 1856. (Dr. Budd.)	Female, 42	Married	Good	A brown tinge of skin, followed by typhoid fever; after which bronzing became more marked.	Skin like that of a North American Indian; certain parts darker than others.
25.	<i>Ibid.</i> Jan. 19. 1856. (Dr. Budd.)	Female, 40	Not stated	Not stated	Not stated	Very dark general discoloration; large patches in mouth.
26.	Med. Times and Gaz., Feb. 23. 1856. (Dr. Thompson.)	Male, 33	Married	Good	Paroxysmal pain in the abdomen; loss of strength; amenorrhoea.	Skin became suddenly and generally of a dirty-brown tinge.
27.	<i>Ibid.</i> Dec. 22. 1855. (Dr. Rankin.)	Female, 58	Married	Formerly very stout and of large frame.	Loss of strength and flesh.	Face and hands dark brown—"as brown as a Japanese;" other parts not seen.
28.	Trans. of Path. Soc., vol. viii. p. 325. (Dr. Baly.)	Male, 18	Baker	Headache; pains in the limbs; languor and debility; followed by pain in the loins.	As stated; with bronzing of the skin; pain increased by pressure on the loins; vomiting, &c.	Bronzing deep and general
29.	<i>Ibid.</i> vol. viii. p. 330. (Dr. Baly.)	Not stated	Not stated	Diseased vertebral column.	Not stated	No bronzing of the skin
30.	<i>Ibid.</i> vol. viii. p. 330. (Dr. J. Ogle.)	Female, 14	Not stated	Incontinence of urine, scalding, containing blood and pus.	Consequent on the urinary disorder; symptoms of phthisis, under which she sunk.	No bronzing of the skin
31.	<i>Ibid.</i> vol. viii. p. 332. (Dr. J. Ogle.)	Male, 36	Not stated	Emaciation, &c.	Symptoms of phthisis	No bronzing of the skin
32.	<i>Ibid.</i> vol. viii. p. 333. (Drs. Peacock and Bristowe.)	Female, 18	A tent-maker	Had a fall, and severe pain in the right side.	Fever, with pains in the lower extremities; oedema, &c.	No bronzing of the skin
33.	<i>Ibid.</i> vol. viii. p. 337. (Drs. Peacock and Bristowe.)	Male, 55	Coppersmith	Good	Declined in flesh and strength; pains in back and limbs.	No discoloration of the skin.
34.	Med. Times and Gaz., Nov. 21. 1857. (Mr. Wilks.)	Female, 18	Young lady	Delicate, but of full habit.	General debility and chronic rheumatism; lassitude and sickness,	A deep bronze tint of skin.

17. Mr. HUTCHINSON has collected a number of the cases which have been recorded, and has given a view of the chief symptoms which have characterised them. I shall notice these symptoms briefly and in succession, but independently of his account of them.—1st. *Bronzing of the skin* was observed in the majority of cases of structural lesion of the supra-renal capsules, recorded by Dr. ADDISON and some others, and this physician was inclined to believe that this symptom was indicative of such lesion. Several cases have more recently been observed where lesions of these capsules have been found without this change

of the colour of the skin, and without any change whatever. Several such instances are recorded in the 8th vol. of the Transactions of the Pathological Society.—2d. *Great debility*, without any evidence of thoracic or organic disease, loss of mental energy, faintness, exhaustion, &c., were very general symptoms.—3d. *Irritability of stomach*, nausea, occasional or frequent vomitings, were also prominently observed.—4th. *Pain in the epigastrium, back, and loins*, sometimes acute, in some instances dull, or an aching merely, was general.—5th. *Anæmia* was, also, generally present, this fluid being impoverished and abounding

GENERAL SYMPTOMS, COMPLICATIONS, &c.	DURATION OF DISEASE.	MODE OF DEATH.	INSPECTION AFTER DEATH.	REMARKS.
Some emaciation; great and increasing debility; oppressed aspect; urine healthy.	9 months	Sunk from diarrhoea; a succession of convulsions just before death.	No autopsy - - - -	Gradually increasing prostration for four months.
Countenance expressive of great languor; emaciation; marked debility; liability to faintings, &c.	18 months	Suddenly, from an epileptic fit.	A chalky concretion found in the medulla oblongata. The supra-renal bodies said to be free from disease.	
Appetite very bad; thirst; great debility; pain in the loins; menorrhagia; anxious expression.	7 months	Not known - -	No inspection.	
No material loss of health until within a few weeks of death; debility; loss of appetite; irritability of stomach supervened; failure of memory for some months; urine normal.	3 years -	From incessant vomitings; delirious before death.	The chief lesion observed was tubercles in the lungs. The supra-renal bodies were not examined.	A peculiar and disgusting odour a few days before death.—See case 16.
About eight months after the first bronzing she began to lose flesh and strength; harassing cough; irritability of stomach; extreme anæmia; and debility supervened.	16 months	Sank gradually from exhaustion.	No autopsy - - - -	Eight months after the change of colour began the patient had a fine healthy infant.
Anæmia and extremely feeble; sickness and vomiting.	Not stated	Gradually sank from exhaustion.	No autopsy - - - -	This case very closely resembled the preceding one.
Anæmic and feeble, followed by discoloration of skin, and by a peculiar collapse.	3 weeks -	Recovered under the use of tonics; the skin becoming simply pallid.	Recovered - - - -	Inflammatory disease of supra-renal bodies may be conjectured.
Sinking at pit of stomach; nausea; loss of appetite, strength, &c.; secretions healthy; heart's action very feeble.	Not stated	Still living - -	Living at time of Report - -	The symptoms combine to indicate disease of supra-renal bodies.
Fever; small, feeble, and quick pulse; severe pain in loins, increased by pressure; frequent vomiting; tendency to diarrhoea; abdomen flat, empty, and tender; urine albuminous; peculiar odour of skin.	12 months	Exhaustion; stupor; unconsciousness.	Both supra-renal bodies atrophied, and their entire structure destroyed. History and inspection fully given, with a plate.	The case very chronic, well-marked, and the supra-renal bodies most completely disorganised. A very interesting case.
Disease of the vertebral column, apparently causing death.	Not stated	Not stated - -	Both supra-renal bodies contained nodules of firm substance, grey and semi-transparent externally, and yellow and opaque internally. A great part of their proper structure unaltered.	Apparently an earlier stage of the lesions observed in case No. 25.
Phthisis; under which she sunk -	Not stated	Died from scrofulous deposits, and vomica in lungs.	Extensive deposits of crude tubercular matter in both supra-renal bodies, and in the lungs and left kidney.	No symptoms but those of phthisis mentioned.
Hectic and symptoms of phthisis	Not stated	Died from phthisis	Extensive deposit of scrofulous matter in one supra-renal body; the other not affected.	No symptoms excepting those of phthisis mentioned.
Tumour in left side of abdomen; emaciation; prostration; liver enlarged; the spine very prominent at the last dorsal vertebra, &c.	3 months	Exhaustion -	Cancer of both supra-renal bodies, and cancerous deposits in both kidneys and in other parts.	History, case, and of the diseased appearance fully and interesting.
Emaciation; care-worn countenance; retraction of gums, loss of teeth, sordes on the gums, &c.; general want of power; pains in the loins, &c.; anæmia.	4 months	Exhaustion -	Supra-renal bodies both destroyed, their substance being replaced by a soft white encephaloid deposit; similar deposits in the lungs.	History and morbid appearances fully detailed.
Sickness; feeble pulse; fits of incessant vomiting, returning after short intervals, for seven weeks; emaciation.	12 months or more.	Exhaustion -	Both supra-renal bodies enlarged, inflamed, and contained purulent matter, with gritty matter in the right.	No other visceral disease observed.

with white corpuscles, the soft solids being flabby.—6th. *Feebleness of the heart's action*, a soft, compressible, feeble, and more rarely a quick pulse were usually observed.—7th. *A cachectic, leuco-phlegmatic, and unhealthy appearance of the body*, with or without emaciation, were frequently remarked.—8th. *A disagreeable and peculiar odour* was exhaled from the body, in some cases, during life; and—9th. *Several nervous and convulsive symptoms* were observed in a few instances. The tongue, the bowels, and the urine, did not present much indication of disorder. *Death* appeared to result chiefly from vital depression or exhaustion,

with more or less indications of alteration of the circulating fluids. In some cases, death was attributable to the disease with which the lesion of the supra-renal bodies was complicated, as to cancer, tubercular disease of the lungs, &c. The circumstance of one of those bodies only being diseased, and the extent to which the structure of one or both had been destroyed, may be viewed as modifying or altogether altering the symptoms and the final issue.

18. ii. *The chief lesions of these bodies* which have been recorded are the following:—(a) Appearances of acute inflammation and its esse-

## Form. 21. BALSAMUM SULPHURIS, vel OLEUM SULPHURIS.

R. Florum Sulphuris partem j.; Olei Amygdal. Dulc. part. ij.; Olei Anisi part. ij. Macera per dies septem in balneo arenario.

Form. 22. BALSAMUM SULPHURIS TEREBINTHINATUM. (*Balsamum Vitæ Rulandi.*)

R. Florum Sulphuris part. ij.; Olei Lini part. vij.; Olei Anisi part. v. Solve in balneo arenario, et adde Olei Terebinthinæ part. xx. Misce. (Excitant, diuretic, expectorant, &c. Dose M x.—xxx.)

## Form. 23. BALSAMUM TEREBINTHINATUM.

R. Olei Olivæ 3 vj.; Terebinthinæ 3 ij.; Cerae Flavæ 3 j.; Bals. Peruvian. 5 ij.; Camphoræ rasæ 3 jss. Solve Oleum, Terebinth., et Ceram; dein adde alia. (Nearly the same as the Balsam of Chiron, a long celebrated medicine.)

## Form. 24. BOLUS ANODYNUS.

R. Pulv. Jacobi veri gr. lv.; Camphoræ Pulverizat. gr. ij.; Pulv. Potassæ Nitratis gr. x.; Extracti Hyoscyami gr. vij.; Conservæ Rosar. q. s. ut fiat Bolus. H. s. s. (In Cerebral Affections, &c.)

## Form. 25. BOLUS ANTE SPASMOS.

R. Pulveris Castorei Optimi 3 ij.; Pulv. Radicis Valerianæ 3 ss.; Camphoræ rasæ 5 j. Misce accuratè, et adde Syrupi Papaveris satius quantum ut fiant Boll granorum duodecim: involvantur pulvere Stigmatum Croci Sativi.

## Form. 26. BOLUS ARNICÆ.

R. Pulv. Flor. Arnicæ Montan., Camphoræ rasæ, aa, gr. lv.; Conservæ Rosar. q. s. ut fiat Bolus.

## Form. 27. BOLUS BISMUTHI COMPOSITUS.

R. Moschi gr. x.; Bismuthi Trinitratis gr. ij.—vij.; Opii Puri gr. ss.—j.; Conservæ Rosar. q. s. ut fiat Bolus, pro re natâ sumendus.

## Form. 28. BOLUS CAMBOGLE.

R. Cambogię Gummi Resinæ gr. vij.; tere cum Olei Juniperi M ij., et adde Potassæ Bitart. gr. xx.; Pulv. Scillæ, gr. j.; Syr. Zingiberis q. s. ut fiat Bolus.

## Form. 29. BOLUS CAMPHORÆ.

R. Camphoræ rasæ et ope Alcoholis subactæ gr. ij.—x.; Pulv. Flor. Arnicæ Montanæ gr. ij.—vj.; Confect. Rosæ Caninæ q. s. ut fiat Bolus, quartâ vel sextâ quaque horâ sumendus.

## Form. 30. BOLUS CATECHU THEBAIACUS.

R. Catechu Ext. contriti gr. xv.; Confectionis Opii gr. viij.; Pulv. Cretæ gr. lv.; Syrupi Aurantii q. s. ut fiat Bolus, bis, ter, sæpiusve in die deglutendus.

## Form. 31. BOLUS FERRI.

R. Ferri Sesquioxidi gr. x.—xx.; Pulv. Aromatici gr. v.; Syrupi Zingiberis q. s. ut fiat Bolus, bis terve quotidie deglutendus.

## Form. 32. BOLUS GUAIACI AMMONIATI.

R. Guaiaci Gum. Resinæ gr. vij.—xij.; Camphoræ rasæ, Ammonie Sesquicarbon., aa gr. lv.; Pulv. Acaciæ gr. ij.; Confect. Rosæ q. s. ut fiat Bolus, horâ somni sumendus.

## Form. 33. BOLUS GUAIACI COMPOSITUS.

R. Guaiaci Resin. cont. 3 j.; Ipecacuanhæ Rad. Pulv. gr. j.; Opii Puri gr. j.; Confectionis Rosæ Caninæ q. s. ut fiat Bolus, semel, bis, terve quotidie capiendus.

## Form. 34. BOLUS KINO THEBAIACUS.

R. Pulv. Kino Compos. gr. v.—x.; Pulv. Cretæ Compositi gr. xv.; Pulv. Opii gr. ss.; Syr. Zingib. q. s. ut fiat Bolus, bis, ter, sæpiusve in die sumendus.

## Form. 35. BOLUS MOSCHI COMPOSITUS.

R. Moschi gr. xxiv.; Pulv. Rad. Valerianæ 3 ij.; Camphoræ rasæ gr. xx.; Conservæ Rosar. q. s. ut fiant Boll iv. Capiat unam 4â quaque horâ.

## Form. 36. BOLUS NITRO-CAMPHORATUS CUM OPIO.

R. Camphoræ rasæ gr. ij.—vij.; Potassæ Nitratis gr. x.—xv.; Opii Puri gr. ss.—jss.; Conservæ Rosar. q. s. ut fiat Bolus, horâ somni sumendus.

## Form. 37. BOLUS RHEI COMPOSITUS.

R. Rhei Pulv. gr. x.—xv.; Pulv. Cretæ Comp. gr. vij.; Pulv. Ipecacuanhæ Comp. gr. ij.—vij.; Syrupi Zingiberis q. s. ut fiat Bolus, horâ somni sumendus.

## Form. 38. BOLUS SEDATIVUS.

R. Acidi Boracici 3 j.—3 ss.; Conserv. Rosar. et Syrupi q. s. ut fiat Bolus, pro re natâ sumendus.

## Form. 39. BOLUS SUDOREM CRENÆ.

R. Camphoræ rasæ gr. j.—ij.; Potassæ Nitratis gr. xij.; Pulv. Ipecacuanhæ, et Pulv. Opii Puri, aa gr. j.; Syrup. Zingib. q. s. ut fiat Bolus.

## Form. 40. BOLUS VALERIANÆ CUM FERRO.

R. Ferri Sesquioxidi gr. v.—3 j.; Pulv. Valerianæ 3 ss.; Syrupi Zingib. q. s. Fiat Bolus.

## Form. 41. CATAPLASMA IODURETUM.

R. Cataplasma. Farinæ Semin. Lini tepid. q. s.; Solat. Iodinæ Rubef. q. s. Sit Cataplasma.

## Form. 42. CATAPLASMA SINAPROS FORTIUS.

R. Pulv. Sinapros lb ss.; Pulv. Capsici Anni, Pulv. Zingiberis, aa 5 j.; Acidi Acetici Pyrolignei q. s. ut fiat Cataplasma; dein adde Olei Terebinthinæ 3 j. Misce.

## Form. 43. CATAPLASMA SINAPROS MITIUS.

R. Cataplasmatibus Lini part. ij.; Farinæ Sinapros pars j. M.

## Form. 44. CONFLICTIO MENTHÆ VIRIDIS.

R. Menthæ Viridis Fol. recent. 3 iv.; Sacchari Purificati 3 xij. Folia in mortario lapideo contunde: tum, adjecto Saccharo, iterum contunde, donec corpus sit unum. (SPRAGUE.)

## Form. 45. CONFLICTIO SENNÆ COMPOSITA.

R. Sulphuris Sublimati, Potassæ Sulphatis, aa 3 ss.; Confectionis Sennæ 3 ij.; Syrupi Aurantii q. s. Capiat 5 j.—3 ij. pro dose.

## Form. 46. CONSERVA ACETOSELLE.

R. Fol. Acetosellæ 3 iv.; Sacchari Purificati 3 xij. Contunde probè simul, et fiat Conserva.

## Form. 47. DECOCTUM ALTHÆÆ.

R. Althææ Radicis exsiccate incis. 3 ij.; Rad. Glycerhizæ contus. 5 ij.; Aquæ Destillatæ, O Jas. Coque lent igne ad O j., et cola.

## Form. 48. DECOCTUM ARCTII LAPPÆ.

R. Rad. Arctii Lappæ 3 jss.—3 ij.; Aquæ 3 xxv. Coque ad 5 xij., et cola.

## Form. 49. DECOCTUM ARCTII LAPPÆ COMPOS.

R. Rad. Arctii Lap. recent. 3 ij.; Lign. Sassafras, Dulcamaræ, aa 5 ij.; Rad. Glycerrh. 3 jss.; Aquæ O Jas. Coque ad O. j., et exprime.

## Form. 50. DECOCTUM ET INFUSUM BECCABUNGÆ.

R. Herbæ Veronicæ Beccabungæ recentis 3 ij.; Aquæ Ferventis O j. Macera per horas binas, vel exsiccæ per quartam horæ partem, et exprime. Capiat 5 j. ter quaterve quotidie, vel utatur extertis pro embrocatione, super Ulcerationes Strumosas apphensas.

## Form. 51. DECOCTUM CALUMBÆ COMP.

R. Rad. Calumbæ, Lign. Quassie ras., aa 3 ij.; Corticis Aurantii exsic. 3 j.; Rhei Pulv. 3 j.; Potassæ Carb. 5 j.; Aquæ 3 xx. Coque ad 3 xv., et cola; dein adde Tinct. Lavandul. Comp. 3 j. (SIEMANN.)

## Form. 52. DECOCTUM CACUMINUM PINI COMPOSITUM.

R. Cacum. Pini Sylvest. 3 ij.; Radicis Symplyphyti Majoris 3 j.; Aquæ lb ij. Coque per horæ partem quartam; exprime, et cola.

## Form. 53. DECOCTUM CINCHONÆ APERTIENS.

R. Corticis Cinchonæ Pulv. 3 j.; Aquæ lb ij. Coque per partem horæ quartam, et adde Fol. Sennæ 3 ss.; Rad. Zingiberis cont. 5 j.; Sodæ Sulphatis 3 ss.; Hydrochlor. Ammonie 3 j. Macera per horas binas, et adde Tinct. Sennæ Comp. 3 j. M.

## Form. 54. DECOCTUM CINCHONÆ COMPOSITUM.

R. Cinchonæ Lancifol. Cort. contus. 3 ss. Coque ex Aquæ Puræ 3 xvj. ad consumpt. dimid., adjecti cum Confectionis Serpentinæ Radicis contusæ 3 ij. Stent per horam, et cola; dein adde Spirit. Chinensis Comp. 3 jss.; Acidi Sulphur. dilut. 3 jss. M. Sumantur 3 ij. sextâ quaque horâ.

## Form. 55. DECOCTUM CINCHONÆ ET RHEI.

- R Corticis Cinchonæ Oblongifol. contusæ 5 ij.; Radicis Gentianæ incisæ 5 ss.; Radicis Rhei Palmati 5 jss.; Carbonatis Potassæ 3 j.; Aquæ Fontanæ s. q. Coque per horam unam ut obtineatur colatura uncie duodecim, et cola.
- R Liquoris Colati 3 vss.; Tincturæ Canellæ, Spirit. Anisi, aa 3 jss.; Syrupi Aurantii, 3 ss. M. Capiat Cochlear. j. vel ij. ampla.

## Form. 56. DECOCTUM CINCHONÆ ET SERPENTARIÆ.

- R Cort. Cinchonæ pulveris. 3 vj.; Rad. Serpentariæ 3 ss.; Corticis Aurantii sic. 5 ij.; Aquæ lbjss. Coque ad lbj., et adde liq. colato, Tinct. Cinnamon. 5 j.

## Form. 57. DECOCTUM CYDONIÆ COMP.

- R Semina Cydon. contus. 5 ij.; Rad. Glycyrrh. contus., Fici Caricæ Fruct., aa 3 j.; Aquæ Bul. Oj. Coque cum igne leni per partem horæ quartam, deinde cola.

- R Hujus Decocti 3 vjss.; Bi-boratis Sodæ 3 j.; Potassæ Tart. 5 ij.; Spirit. Ether. Nit. 5 ij.; Syrupi Mori vel Suc. Inspiss. Samb. Nig. 3 ss. M. Fiat Mist., cujus capt. Cochlearia ij. larga, secundis vel tertius horis. (In the Irritative Inflammation of the Mucous Surface of the Digestive Organs, Dropsy, &c.)

## Form. 58. DECOCTUM DEOBSTRUENS.

- R Radicis Taraxaci, Herbe Fumarie, Fol. Sisymbrii Nasturt., Fol. Cheryphylli Sylvest., aa 3 j. Omnibus bene concisis, adde Seri Lactis 3 xxxij. Coque per minuta horæ vj.; et postea acera ad refrigerationem; delu cola. Colatura adde Sodæ Potassio-Tartrat. 3 ss.—5 vj.; Mellis Optimi 3 j. M. Capiat Cyathos Vin. ij. vel liq. vel iv. in die. (VAN SWIETEN.)

## Form. 59. DECOCTUM DEPURANS.

- R Caul. Dulcamaræ, Herbe Fumarie Officin., Cort. Ulmi contusi, Rad. Arctii Lappæ conc., Rad. Rumicis Patientiæ concis., aa 3 ss.; Aquæ Font. lbjss. Coque ad Ojss., et cola. Liq. colato adde Syrupi Sarzæ 5 ij. M. Capiat 5 j.—3 jss. ter quaterve quotidie.

## Form. 60. DECOCTUM DULCAMARÆ.

- R Stiptum Dulcamaræ 3 j.; Corticis Aurantii 5 ij.; Aquæ lbjss. Coque ad lbj., et cola.

## Form. 61. DECOCTUM DULCAMARÆ COMP.

- R Caul. Dulcamaræ, Radicis Arctii Lappæ, aa 3 vj.; Radicis Glycyrrh., Ligni. Sassafras ras., Ligni. Guaiaci ras., aa 3 ij.; Aquæ Font. lbj. Coque ad colaturæ 3 xx. (AUGUSTIN. Rheumatism, Syphilis, Cutaneous Affections, &c.)

## Form. 62. DECOCTUM FILICIS COMPOSITUM.

- R Radicis Filicis Maris 3 j.; Rad. Inulæ Heleni 3 ij.; Folior. Absinthii 3 ss.; Seminum Santonice cont. 5 ij.; Aquæ Ojss. Coque ad Oj., et cola. Liq. colato adde Syrupi Rhamni 3 j. M.

## Form. 63. DECOCTUM GALLÆ.

- R Callarum contosarum 3 ss.; Aquæ Destillatæ Ojss. Deoque ad oct. ij., et liqoreum cola. Tum adde Tincturæ Gallæ 3 j. (This decoction, used as a fomentation, enema, or injection, is of considerable use in the treatment of Prolapsus Ani, Hemorrhoids, and in Leucorrhœa.)

## Form. 64. DECOCTUM GENTIANÆ COMP.

- R Radicis Gentianæ Luteæ incisæ 5 ss.; Aquæ Fontanæ lbj. Coque per semihoram, deinde infunde quantum sufficit super Radicis Calami Arom. 3 ij.; cola, et post refrigerationem adde Etheris Sulph. 5 ij.; Syrupi Aurantii 3 ss. Misce.

## Form. 65. DECOCTUM GUAIACI ET DULCAMARÆ COMP.

- R Rasur. Ligni Guaiaci 3 jss.; Stipt. Dulcamaræ 3 jss.; Rad. Lauri Sassafras concis., Flor. Arlicæ, Rad. Calami Arom., Rad. Glycyrrh., aa 3 ss.; Semin. Foeniculi 5 ij.; Aquæ lbj. Coque ad lbj., et cola. Capiat 3 j.—3 ij. ter quaterve quotidie.

## [Form. 66. DECOCTUM HELENI COMP.]

- R Rad. Inulæ Heleni 3 j.; Summit. Hyssopi Officin. 3 ij.; Fol. Heder. Terrest. 5 ij.; Aquæ q. s. ut sint Colaturæ 3 xij. Coque per partem horæ quartam, et cola; adde liq. colato, Potassæ Carbon. 5 j.; Syrupi Tolutani, Syrupi Althææ, aa 3 j. M. Capiat 3 j.—3 ij. ter quaterve quotidie. (In Chronic Catarrhs, the Pectoral Affections of Debility, Asthma, Chlorosis, Amenorrhœa, &c.)

## Form. 67. DECOCTUM INULÆ COMPOSITUM.

- R Rad. Inulæ Helen. 3 jss.; Hyssopi Officinalis, Flor. Tillie Europææ, aa 5 ij.; Fol. Heder. Terrest. 5 vj.; Aquæ lbj. Coque ad lbjss.; exprime, et cola. Colaturæ adde Spirit. Ether. Nit. 3 ss.; Potassæ Nitratis 5 j.; Syrupi Scillæ 5 ij.; Syrupi Althææ 3 ss. M.

## Form. 68. DECOCTUM PECTORALIS ELSNERI.

- R Rad. Glycyrrh., Croci Stig., Rad. Inulæ Heleni, Rad. Iridis Flor., Semin. Anisi, Hyssopi Officin., aa 3 ss.; Aquæ lbj. Coque ad lbjss.; cola, et adde Tinct. Bals. Tolutani 3 j.; Syrupi Tolutani 5 j.; Mellis 3 j. M. Capiat 3 j.—3 ij. 4tis vel 6tis horis.

## Form. 69. DECOCTUM PUNICÆ GRANATI.

- R Corticis Radicis Punicæ Granati recent. et exsicc. 3 ij.; Aquæ Com. O ij. Macera sine calore per horas xxiv.; dein coque ad Oj., et cola. (The whole to be taken in three doses within two hours.)

## Form. 70. DECOCTUM QUASSIÆ COMP.

- R Ligni Quassie rasæ 3 ss.; Flor. Anthemid. 5 vj.; Potassæ Carbon. 5 jss.; Aq. Fontan. lbj. Coque ad dimidium, et cola.

## Form. 71. DECOCTUM SANTONICI.

- R Santonici Semin. contus. 5 ij.; Aquæ Destillatæ 3 xx. Coque lento igne ad Oj., et cola. (In Ascariæ.)

## Form. 72. DECOCTUM SARZÆ COMPOSITUM.

- R Sarzæ Radicis, concisæ et contusæ, 5 jss.; Glycyrrhizæ Radicis contusæ 3 ss.; Coriandri Seminum contus. 5 ij.; Liquoris Potassæ 5 j. (vel sine); Aquæ Fer-ventis O j. Macera per horas xxiv. in vase leviter clauso, et cola; liquoris colati sumat partem 3itiam ter quotidie. (SPRAGUE.)

## Form. 73. DECOCTUM SECALIS CORNUTI.

- R Secalis Cornuti 5 ij.; Aquæ 3 vj. Deoque ad 3 lv. Ab igne remove, et paulo post è facibus effunde.

## Form. 74. DECOCTUM SENEGÆ.

- R Senegæ Radicis cont. 5 vj.; Aquæ O ij. Coque ad O j.; et sub finem coctionis adde Glycyrrh. Rad. contusæ 3 ss. Exprime, et cola.

## Form. 75. DECOCTUM SCOPARI CACUMINUM.

- R Scoparii Cacuminum concisæ 3 j.; Aquæ Destillatæ O j. Deoque ad octarium dimidium, et cola.

## Form. 76. DECOCTUM TARAXACI COMP.

- R Radicis Taraxaci 3 iv.; Bitart. Potassæ, Bi-boratis Sodæ, aa 3 ss.; Aq. lbj. Coque ad lbj.; et adde, ut sit occasio, vel Spirit. Ether. Nit., vel Tinct. Scillæ, vel Spirit. Juniperi Comp., vel Oxy mel Scillæ.

## Form. 77. DECOCTUM TARAXACI COMP. STOLLII.

- R Rad. Taraxaci, Rad. Tritici Rep., aa 3 ij.; Aq. lbj. Coque ad lbj.; cola, et adde colaturæ, Potassæ Sulph. 3 ss.; Oxy mel. 3 j. M. (In Visceral Obstructions.)

## Form. 78. DECOCTUM TORMENTILLÆ.

- R Tormentillæ Radicis contusæ 5 j.; Aquæ Destillatæ Ojss. Coque ad octarium, et cola.

## Form. 79. ELECTUARIUM ALKALINO-FERRATUM.

- R Sesquioxidi Ferri 3 ss.; Potassæ Carbonatis 5 j.; Carbonat. Calcis 3 ij.; Pulv. Zingiberis 3 jss.; Syrupi Aurantii 3 ijss. M. Fiat Elect. cujus capiat Coch. j. minim. mane nocteque. (Chlorosis, Cholera, &c.)

## Form. 80. ELECTUARIUM ANTHELMINTICUM.

- R Pulv. Valerianæ, Semin. Santonice contus., aa 3 ss.; Potassæ Sulphatis 5 ij.; Pulv. Jalap. 3 iv.; Oxy mel. Scillæ 3 iv.; Pulv. Glycyrrh. (vel Extr. Glycyrrh.) 3 ij. M. ut fiat Electuarium. (For children, one to two drachms; and for adults, 3 ss., three or four times daily.)

## Form. 81. ELECTUARIUM ANTISPASMODICUM.

- R Pulv. Cinchonæ 3 j.; Pulv. Valerianæ 3 ss.; Confect. Rubæ 3 j.; Confect. Ros. Gall. 3 ss.; Confect. Aurantii 5 ij.; Olei Cajuputi 5 ss.; Syrupi Aurantii 5 jss. vel q. s. ut fiat Electuarium molle. Capiat 3 j.—3 ij. mane nocteque. (In Epilepsy, Chorea, Hysteria, Flatulency, &c.)

## FORM. 144. ENEMA EMOLLIO-APERIENS.

R Decocti Malvæ Comp. ʒ xij.; Sodæ Potassio-Tartratis ʒ ss.; Olei Olivæ ʒ ij. M. Fiat Enema.

## FORM. 145. ENEMA OPIATUM.

R Tincturæ Opii ʒ j.; Mucilag. Amyli ʒ vj. Decocti Hordei ʒ x. Misce. Fiat Enema, tepidum injiciendum.

## FORM. 146. ENEMA SAPONIS.

R Saponis Mollis ʒ j.; Aquæ Vitæ Oj. Solve, et tepidum exhibe.

## FORM. 147. ENEMA SEDATIVUM.

R Seminum Lini contus. ʒ j.; Aquæ Herventis ʒ viij. Macera per horam; dein cola, et solve in Liq. colato Bi-boratis Sodæ ʒ j.; Opii Extr. gr. ij.—iij. M. Fiat Enema.

## FORM. 148. ENEMA SEDATIVUM CAMPHORATUM.

R Infusi Lini Comp. ʒ xij.; Tinct. Opii ʒ ss.; Bi-boratis Sodæ ʒ ss.; Camphoræ rasæ gr. x. M. Fiat Enema, bis terve in diē injiciendum.

## FORM. 149. ENEMA TEREBINTHINATUM.

R Camphoræ rasæ ʒ j.; Olei Terebinth. ʒ ss.—ʒ jss.; Olei Olivæ ʒ jss.; Decocti Avæ ʒ xij. Fiat Enema.

## FORM. 150. ENEMA TEREBINTHINÆ.

R Terebinthinæ Vulgaris ʒ j. (vel Olei Terebinthinæ ʒ ss. ad ʒ jss.); Ovi unius Vitellum. Tere simul, et gradatim ad Decocti Avæ tepid. ʒ xv. Injiciatur pro Enemate semel in diē, pro re nata. (When it is required to evacuate the lower bowels, Ol. Ricini ʒ j. will be found a useful addition.)

## FORM. 151. ENEMA TEREBINTHINO-CAMPHORATUM.

R Olei Terebinth. ʒ j.; Olei Olivæ ʒ jss.; Camphoræ rasæ gr. xv.; Decocti Avæ ʒ xvj. M. Fiat Enema.

## FORM. 152. ENEMA TREBIAIACUM.

R Opii Puri gr. j.—iij.; Mucilag. Acacæ ʒ ss.; Lactis Tepefact. ʒ xvj. Misce pro Enemate.

## FORM. 153. ENEMA VERMIFUGUM.

R Rad. Valerianæ, Herbæ Absinthii, Herbæ Tanacetii Cicutum. (vel Sem.) Santonicæ, aa ʒ ij.; Ag. Fervidæ ʒ xvij. Macera per horas binas, et cola. Liq. colato adde Sodii Chloridi ʒ ss. Fiat Enema.

## FORM. 154. EXTRACTUM ALOES ALKALINUM COMP.

R Aloes Spicati Extr. contrit. ʒ ij.; Zingiberis Radicis concis. ʒ ss.; Myrrhæ Pulv. Croci Stigmat. aa ʒ vj. Potassæ Carbon. (vel Sodæ Carbon.) ʒ ss.; Macera per triduum leni cum calore, dein cola. Liqueorem defæcatum consume, donec idoneam habeat crassitudinem. (Dosis gr. x. ad xxx.)

## FORM. 155. EXTRACTUM DULCAMARÆ.

R Stipit. Dulcamaræ, part. j.; Aquæ Bullient. part. viij. (Split the shoots of dulcamara longitudinally, and macerate them in the water for twelve hours; boil for a quarter of an hour, and express the fluid. Afterwards boil the residue with four parts of water, and finally express. Mix the two liquors, and evaporate with a gentle heat to a proper consistence.)

## FORM. 156. EXTRACTUM HELLEBORI NIGRI BACKERI.

R Radicis Hellebori Nig. exsic. lb ij.; Potassæ Carbon. lb ss.; Alcohol. (22 grad.) lb viij.

(BACKER directs the above to be digested in a sand-bath for twelve hours, shaking it frequently, and afterwards to be expressed and strained. Eight pounds of white wine are to be poured upon the residue, and digested with it for twenty-four hours in a sand-bath, and afterwards to be expressed and strained. After a few hours both these tinctures are to be mixed together, and evaporated with a gentle heat to the consistence of an extract. This is the best preparation of Hellebore. Dose from x. to xv. grains.)

## FORM. 157. FOMENTUM CAMPHORATUM.

R Camphoræ ʒ ss.; Acidii Acetici ʒ ij.; Aceti Commun. ʒ x. M. (AUGUSTIN.)

## FORM. 158. GARGARISMA ACIDI HYDROCHLORICI.

R Infusi Cinchonæ ʒ vj.; Acidii Hydrochlorici ℥ xx.; Mellis ʒ ss. M.

## FORM. 159. GARG. ACIDI HYDROCHLORICI COMPOSITUS.

R Acidi Hydrochlorici ʒ jss.; Decocti Cinchonæ. Infusi Rosæ Compos. aa ʒ iijss.; Mellis Rosæ ʒ j. M. Fiat Gargarisma.

## FORM. 160. GARGARISMA ANTIREPTICUM.

R Decocti Cinchonæ ʒ vj.; Camphoræ gr. xx.; Ammoniac Hydrochloratis gr. xv. M.

## FORM. 161. GARGARISMA ASTRINGENS.

R Infusus Krameriæ ʒ vjss.; Acidii Sulph. Diluti ʒ ss.; Syrupi Mori ʒ j. M. Fiat Gargarisma. (For Relaxation of the Uvula and Fauces.)

## FORM. 162. GARGARISMA ASTRINGENS ZOBELLII.

R Aluminis Crudi, Potassæ Nitrat. aa ʒ ss.; Potassæ Bitart. ʒ ij.; Aceti Destill. ʒ ij. Solve, et adde Aquæ Rosæ ʒ vj. M. Fiat Gargarisma.

## FORM. 163. GARGARISMA BI-BORATIS SODÆ.

R Bi-boratis Sodæ ʒ ij.; Aquæ Rosæ ʒ vj.; Mellis Despumati, Tincturæ Myrrhæ, aa ℥ ʒ ss. M.

## FORM. 164. GARGARISMA CATECHU THERIAIACUM.

R Infusi Rosæ ʒ viij.; Tincturæ Catechu ʒ vj.; Acidii Sulphurici Diluti ʒ j.; Tincturæ Opii ʒ jss. Sibi Gargarisma saepe utendum. (A. T. THOMSON.)

## FORM. 165. GARGARISMA COMMUNE.

R Aquæ Puræ ʒ xxij.; Bi-boratis Sodæ ʒ x.; Tinct. Catechu ʒ j.—ʒ ij.; Tinct. Capsici Annui ʒ j.—ʒ ij.; Mellis Rosæ ʒ jss.—ʒ ij. Interdum adde, loco Bi-boratis Sodæ et Tinct. Catechu, Acidum Hydrochloricum vel Acidum Sulphuricum.

## FORM. 166. GARGARISMA POTASSÆ NITRATIS. (1.)

R Potassæ Nitrat. ʒ jss.; Mellis Despumati ʒ ij.; Aquæ Rosæ ʒ vj. M. Fiat Gargarisma.

## FORM. 167. GARG. POTASSÆ NITRATIS. (2.)

R Potassæ Nitrat. ʒ ij.; Decocti Hordei ʒ vj.; Oxy-mellis Simplicis ʒ j. M. (BRANDE.)

## FORM. 168. GUTTÆ ACETATIS MORPHIÆ.

R Morphæ Acetat. gr. xvj.; Aquæ Destillatæ ʒ vj.; Acidii Acetici Diluti ʒ ij.; Tinct. Cardamom. Comp. ʒ ss. M.

## FORM. 169. GUTTÆ ÆTHERIS TEREBINTHINATÆ.

R Olei Terebinthinæ part. j.; Æther. Sulphurici (vel Æther. Nitrici) part. ij. M. (Nearly the same as that recommended by M. DURANDE in Jaundice and Biliary Calculi.)

## FORM. 170. GUTTÆ ANODYNÆ.

R Morphæ Hydrochloratis gr. xvj.; Aquæ Destillatæ ʒ j.; Tinct. Lavandul. Comp. ʒ ss. M. (In doses of from v. to xxx. drops.)

## FORM. 171. GUTTÆ ANTILOMOICÆ.

R Pulv. Camphoræ ʒ ij.; Spirit. Rect. ʒ viij.; Liguoris Ammon. ʒ ij.; Ol. Lavandul. ʒ ij. M. Fiat Guttae, quarum capiat xx. ad ʒ j. quoties in idoneo vehiculo.

## FORM. 172. GUTTÆ CONTRA SPASMOS.

R Olei Cajuputi, Tinct. Æther. Valerianæ (vide Form.), Tinct. Ammon. Comp., aa ʒ j.; Olei Anisi ʒ ij. M. (℥ x. ad xxxv.)

## FORM. 173. GUTTÆ CONTRA SPASMOS. (STOLL.)

R Liguoris Ammoniaci Sesquicarbon., Tinct. Castorei, Tinct. Succini, Tinct. Assafoetidæ, aa ʒ ij. M. (℥ l. bis terve in diē.)

## FORM. 174. GUTTÆ NERVINÆ.

R Camphoræ, Croci, aa ʒ jss.; Moschi, Myrrhæ, aa ʒ ij.; tere cum Sacchar. Albi ʒ ss.; et Spirit. Vini Rectif. ʒ j.; dein adde terendo Olei Lavand., Ol. Juniperi, Ol. Rosmarini, Olei Origani, aa ʒ ij.; Olei Sœceti, Olei Cajuputi, aa ʒ j.; Olei Limonis ʒ ss.; Olei Terebinthinæ ʒ ij.; Sacch. Albi ʒ ss.; Spirit. Vini Rect. ʒ ij. Macera et serva in vase bene obturato.

## FORM. 175. HAUSTUS ACIDI NITRICI ET OPII.

R Tinct. Opii ℥ xx.—xxx.; Tinct. Caryoph. (vide Form.) ʒ j.—ʒ ij.; Acidii Nitrici ℥ xx.; Aquæ Pimentæ ʒ j. M. Fiat Haustus.

Form. 176. HAUSTUS ACIDI NITRICI ET OPII.  
 ℞ Acidi Nitrici Diluti ʒss.; Tinct. Opii ʒss.; Infusi Calumbæ ʒj. Miscæ. Fiat Haustus, ter in die capiendus.

Form. 177. HAUSTUS ANODYNUS.  
 ℞ Mist. Camphoræ ʒix.; Potassæ Nitricæ gr. vj.; Spirit. Ætheris Sulph. Compos. ʒj.; Tinct. Opii ℥x.—xij.; Syrupi Papaveris ʒij. Fiat Haustus, horâ decubitus sumendus.

Form. 178. HAUSTUS CONTRA EMESIN.  
 ℞ Infusi Aurantii Comp. ʒx.; Spirit. Menthæ Virid. ʒj.; Liq. Potassæ ℥x.; Magnes. Carbon. ʒj.; Tinct. Hyoscyami ʒss.; Extracti Humuli gr. viij.; Syrupi Zingib. ʒj. M. Fiat Haustus.

Form. 179. HAUSTUS ANTI-EMETICUS.  
 ℞ Magnes. Carbon. ʒj.; Extr. Humuli gr. vj.; Liq. Potassæ ℥viij.; Tinct. Hyoscyami ʒss.; Spirit. Menthæ Virid. ʒj.; Infusi Aurantii Comp. (vel Infusi Caryoph. Comp.) ʒx.; Syrupi Zingiberis ʒj. M.

Form. 180. HAUSTUS APERIENS.  
 ℞ Extracti Rad. Jalapæ gr. xx.; tere cum Amygdal. Dulcibus Num. iv.; Aquæ Cinnam. ʒjss. Fiat Haustus.

Form. 181. HAUSTUS APERIENS EX JALAPÆ ET ALOE.  
 ℞ Pulv. Rad. Jalapæ gr. xvj.; Aloes Socot. gr. x.; tere probe cum Extract. Glycyrrh. ʒss.; Tinct. Rhei ʒj.; Ol. Carui ℥ij.; Aquæ Cinnam. ʒjss. M. Fiat Haustus.

Form. 182. HAUSTUS APERIENS EX SCAMMONIA.  
 ℞ G. R. Scammon. gr. xij.; tere cum Glycyrrh. Extracti gr. xx.; Tinct. Rhei ʒij.; Syrupi Zingiberis ʒj.; Aq. Cinnam. ʒjss. M. Fiat Haustus.

Form. 183. HAUSTUS ASTRINGENS.  
 ℞ Quercûs Corticis cont. ʒss.; Aquæ Ferventis ʒxij. Macera per horam, et cola.

℞ Liqueoris Colati ʒxj.; Tinct. Catechu ʒss.; Tinct. Cardamom. Comp. ʒij.; Syrupi Aurantii Cort. ʒj. Fiat Haustus.

Form. 184. HAUSTUS BORACICUS.  
 ℞ Infusi Lini Co., vel Infusi Althææ Co., ʒjss.; Bi-boratis Sodæ ʒss.; Spirit. Æther. Nit. ʒss.; Syrupi Papaveris, Syrupi Aurantii, aâ ʒss. M. Fiat Haustus, tertius vel quartis horis capiendus.

Form. 185. HAUSTUS CUM CALUMBA ET FERRO.  
 ℞ Infusi Calumbæ ʒxj.; Tincturæ Ferri Sesquichloridi ℥xv.; Tincturæ Calumbæ ʒj. Fiat Haustus, bis die sumendus.

Form. 186. HAUSTUS CAMPHORÆ COMP.  
 ℞ Camphoræ gr. ii.—viij.; Tinct. Calumbæ, Spirit. Anisi, aâ ʒjss.; Aquæ Pimentæ, Aquæ Menth. Virid., aâ ʒv. Tere Camphoram cum Tincturâ et Spiritu; dein adde gradatim Aquas. Fiat Haustus, horâ somni, vel urgenti vomitu, sumendus. Si sit occasio, adde Tinct. Opii ℥x.—xx., vel Tinct. Hyoscyami ℥xv.—xxv.

Form. 187. HAUSTUS CARMINATIVUS.  
 ℞ Magnesæ Carbon. ʒj.; Pulv. Rhei gr. x.—ʒss.; Olei Anisi ℥ij.; Liq. Potassæ ℥xij.; Liqueoris Ammoniacæ ℥xx.; Aquæ Anethi ʒj. M. Fiat Haustus.

Form. 188. HAUSTUS COLCHICI.  
 ℞ Vinl Colchici min. xxv.—xxxv.; Magnes. Carbon. ʒj.; Aquæ Cinnam., Aquæ, aâ ʒvj. M.

Form. 189. HAUSTUS CUM COLCHICO.  
 ℞ Potassæ Sulphatis ʒss.; Sodæ Sesquicarbonatis ʒij.; Aquæ Anethi ʒjss.; Tinct. Calumbæ ʒjss.; Vinl Colchici ℥xxv. Fiat Haustus cum Acidi Tartarici granis quindecim in Aquæ semifulvis-uncia solutis, et in impetu effervescentiæ sumendus.

Form. 190. HAUSTUS CONII.  
 ℞ Infusi Conii (F. 220.) ʒj.; Liq. Ammon. Acet. ʒij.—ʒij.; Tinct. Hyoscyami vel Conii, ℥xv.; Syrupi Papaveris ʒss. M. Fiat Haustus.

Form. 191. HAUSTUS CONII ET HYOSCYAMI.  
 ℞ Extracti Conii, Extracti Hyoscyami, aâ gr. v.; Mucilaginis Acacæ ʒij. Tere simul donec quam optimè miscantur, et deinde adde Liqueoris Ammoniacæ Acetatis, Aquæ Puræ, aâ ʒss.; Syrupi Rhæodis ʒj. Fiat Haustus, quartâ quaque horâ sumendus. (PARIS.)

Form. 192. HAUSTUS DEOBSTRUENS ET ROBORANS.  
 ℞ Rad. Angelicæ contusæ ʒjss.—ʒss.; Rad. Calumbæ contusæ ʒjss.; Rad. Rhei cont. ʒij.; Baccarum Capsici cont. gr. xxv.; Aquæ Ferventis octarium dimidium. Macera per horas duas, deinde cola.

℞ Hujus Infusi ʒx.; Tinct. Calumbæ ʒj.; Potassæ Sulphatis gr. xxv.; Syrupi Aurantii ʒj. M. Fiat Haustus, bis quotidie sumendus.

Form. 193. HAUSTUS DIAPHORETICUS.  
 ℞ Infusi Serpentariæ Comp. (F. 262.) ʒj.; Liq. Ammon. Acet. ʒij.; Syrupi Aurantii ʒj. M. Fiat Haustus, bis terve in die sumendus. (Dyspepsia, with dry harsh skin, languor, and debility of pulse.)

Form. 194. HAUSTUS DIURETICUS. (1.)  
 ℞ Potassæ Acetatis ʒj.; Oxymel. Colchici ʒij.; tere cum Aquæ Fœniculi Dulcis ʒj.; Spirit. Juniperi Comp. ʒij. M. Fiat Haustus, bis terve in die sumendus.

Form. 195. HAUSTUS DIURETICUS. (2.)  
 ℞ Acidi Nitrici Diluti ʒss.; Spiritus Ætheris Nitrici ʒj.; Infusi Digitalis ʒij.; Aquæ Destillatæ ʒix.; Syrupi Zingiberis ʒj. M. Fiat Haustus, ter in die sumendus.

Form. 196. HAUSTUS DIURETICUS. (3.)  
 ℞ Potassæ Acetatis ʒss.; Infusi Quassia, Aq. Cinnamoni, aâ ʒvj.; Aceti Scillæ, Spiritus Ætheris Nitrici, aâ ʒss. M. Fiat Haustus, ter in die capiendus.

Form. 197. HAUSTUS DIURETICUS. (4.)  
 ℞ Tincturæ Jalapæ ʒij.; Aceti Scillæ ʒj.; Aquæ Menthæ Viridis ʒjss. Fiat Haustus.

Form. 198. HAUSTUS EMETICUS EXCITANS.  
 ℞ Pulv. Radicis Ipecacuanhæ ʒss.; Ammoniacæ Sesquicarbon. ʒj.; Aquæ Menthæ Piper. ʒjss.; Tinct. Capsici ʒj.; Olei Anethidis ℥x. M. Fiat Haustus emeticus. (In Poisoning from Narcotics, &c.)

Form. 199. HAUSTUS GUAIACI COMPOSITUS.  
 ℞ Tincturæ Guaiaci ʒj.; Mellis ʒj.; tere simul, et adde Decoct. Senegæ ʒss.; Aquæ Pimentæ ʒj.; Ammoniacæ Sesquicarbonatis gr. vj. Fiat Haustus, sextâ quaque horâ sumendus.

Form. 200. HAUSTUS INFUSI CINCHONÆ CUM ACIDO HYDROCHLORICO.  
 ℞ Pulveris Cinchonæ ʒj.; Confectionis Rosæ ʒjss.; Aquæ Ferventis Oj.; tere bene, et per horam, in vase clauso, infunde.

℞ Liqueoris Colati ʒxj.; Tinct. Cinchonæ ʒj.; Acidi Hydrochlorici Diluti ℥viij. M. Fiat Haustus, ter quotidie sumendus.

Form. 201. HAUSTUS INFUSI CUSPARIÆ COMPOSITUS.  
 ℞ Corticis Cuspariæ contusæ ʒij.; Rad. Calumbæ contusæ ʒjss.; Rad. Rhei ʒj.; Sem. Cardam. contrit. ʒss.; Sem. Anisi cont. ʒss.; Aquæ Ferventis ʒxv. Macera per horas duas, et cola.—℞ Hujus Infusionis ʒj.; Tinct. Cinnam. ʒjss.; Spirit. Ammon. Aromat. ℥xxv.; Syrupi Aurantii ʒj. Fiat Haustus, ter quotidie sumendus. (In all diseases of Debility, excepting Hectic Fever, and in Relaxation of Mucous Surfaces.)

Form. 202. HAUSTUS INFUSI UVÆ URSI ALKALINUS.  
 ℞ Infusi Uvæ Ursi ʒjss.—ʒij.; Potassæ vel Sodæ Carbon. gr. xv.; Tinct. Hyoscyami ʒss. (vel Tinct. Opii Camphor., vel Extr. Conii); Syrupi Papaveris ʒss. Fiat Haustus, ter quaterve quotidie sumendus. (In Affections of the Urinary Organs, and of the Air Passages.)

Form. 203. HAUSTUS INFUSI UVÆ URSI COMPOSITUS.  
 ℞ Infusi Uvæ Ursi (F. 267.) ʒxlv.; Acidi Sulphur. Dil. ℥xx.; Tinct. Digitalis ℥xv.; Syrupi Papaveris Veri ʒjss. M. Fiat Haustus, ter quaterve quotidie sumendus. (In Chronic Laryngitis, Bronchitis, &c.)

Form. 204. HAUSTUS CUM IODINIO.  
 ℞ Liqueoris Potassæ Iodidi Iodur. Concent. (F. 288.) ℥vj.—xv.; Aquæ Destillatæ ʒj.; Syrupi Althææ ʒij. M. Fiat Haustus.

Form. 205. HAUSTUS LAXANS.  
 ℞ Potassæ Tartratis ʒj.; Infusi Sennæ Compos., Aquæ Pimentæ, aâ ʒvj.; Tinct. Jalapæ ʒj. M. Fiat Haustus.

- Form. 206. HAUSTUS CUM PLUMBI ACETATE.
- R Plumbi Acetatis gr. ʒ. Solve in Aquæ Rosæ ʒj.; et adde Oxymellis Simplicis ʒj.; Tinct. Opil ℥v.; Tinct. Digitalis ℥x. Fiat Haustus, quartis vel sextis horis sumendus.
- Form. 207. HAUSTUS QUINÆ ET ZINCI.
- R Zinci Sulphatis gr. ʒ.—j.; Quinæ Sulphatis gr. ʒ.; Infusi Rosæ Compos. ʒx.; Tincturæ Aurantii, Syrupi Aurantii, aa, f. ʒj. M. Fiat Haustus, quartâ quaque horâ sumendus.
- Form. 208. HAUSTUS SEDATIVUS.
- R Extr. Conil. Extr. Hyoscyami, aa gr. iv.; Mucilag. Acaciæ ʒij.; tere simul, deinde adde Liquoris Ammon. Acet. ʒij.; Mist. Camphoræ ʒv.; Syrupi Rheados ʒj. M. Fiat Haustus, quartâ vel quintâ quaque horâ sumendus.
- Form. 209. HAUSTUS SEDATIVUS EMOLLIENS.
- R Infusi Lini Co., vel Infusi Althææ Co., ʒjss.; Bi-boratis Sodæ ʒss.; Spirit. Æther. Nit. ʒss.; Syrupi Papaveris, Syrupi Aurantii, aa ʒss. M. Fiat Haustus, tertiis vel quartis horis capiendus.
- Form. 210. HAUSTUS CONTRA SPASMOS. (1.)
- R Aquæ Menthæ Virid. ʒj.; Liq. Ammon. Acet. ʒij.; Spirit. Ammon. Arom., Spirit. Æther. Sulph. Co., Tinct. Lavand. Co., aa ʒss.; Tinct. Opil ℥xx. M. Fiat Haustus, statim sumendus, et pro re nata repetendus.
- Form. 211. HAUSTUS CONTRA SPASMOS. (2.)
- R Infusi Caryophyl. ʒjss.; Spirit. Pimentæ, Spirit. Rorismarini, aa ʒss.; Tinct. Opil ℥xx.; Olei Cajuputi ℥x. M. Fiat Haustus, ut supra sumendus.
- Form. 212. HAUSTUS CONTRA SPASMOS CUM PILULA CAMPHORÆ.
- R Mist. Camphoræ ʒj.; Spirit. Ætheris Sulphur. Comp., Tinct. Camphoræ Comp., aa ʒj.; Tinct. Hyoscyami ʒss.; Syrupi Papaveris ʒjss. M. Fiat Haustus, interdum cum Pilula sequenti sumendus.
- R Camphoræ rasæ gr. j.—ij.; Ammon. Sesquicarbon. gr. ij.—vj.; Mucilag. Acaciæ q. s. M. et fiat Pil. j. vel ij.
- Form. 213. HAUSTUS STIMULANS.
- R Aq. Cinnamon. ʒjss.; Magnes. Carbon. ʒss.; Spirit. Ammon. Arom. ʒss.; Spirit. Æther. Arom. ʒj.; Olei Rorismarini ℥vj. M. Fiat Haustus.
- Form. 214. HAUSTUS STOMACHICUS.
- R Calumbæ Rad. concisæ ʒj.; Acori Calami Rad. contusæ ʒss.; Rhel Rad. contusæ ʒjss.; Cardam. Sem. contrit. ʒss.; Aquæ ferventis octarium dimidium. Macera per horas, et cola. —R Hujus Infusionis ʒxij.; Tinct. Aurantii ʒj.; Potassæ Carbon. (vel Sodæ Sesquicarbonat.) gr. xij. Misce. Fiat Haustus, bis terve quotidie sumendus.
- Form. 215. HAUSTUS STOMACHICUS APERIENS.
- R Sodæ Pot.-Tartaratis ʒij.; Sodæ Sesquicarbonatis ʒij.; Aquæ Anethi ʒss.; Infusi Anthemidis ʒj.; Tinct. Calumbæ, Tinct. Aurantii Co., aa ʒj. M. Fiat Haustus cum Acidâ Tartarici granis quindecim, in Aquæ semiluid-uncia solutis, in impetu effervescentie sumendus.
- Form. 216. HAUSTUS TEREBINTHINATUS APERIENS.
- R Olei Terebinth. ʒij.—ʒv. Olei Ricini ʒjss.—ʒss.; Olei Limonis, et Olei Cajuputi, aa ℥iv. ad xij.; Magnesii ʒss.; Aquæ Menthæ Virid. ʒj.—ʒij. M. Fiat Haustus, pro re nata capiendus. (In Puerperal, Infectious, and Malignant Fevers.)
- Form. 217. HAUSTUS CUM UVA URSI.
- R Pulv. Fol. Uvæ Ursi gr. xv.—ʒj.; Potassæ Nitratis gr. xij.; Pulv. Tragacanth. Comp. ʒj.; Aq. Anethi ʒjss. M.
- Form. 218. INFUSUM AMARUM.
- R Summit. Absinthii Artem. ʒj.; Corticis Aurantii ʒss.; Rhel ʒij.; Rad. Gentianæ ʒj.; Aquæ Ferventis ʒxij. Macera per horam, et cola.
- R Liq. Colati ʒjss.; Potassæ Carbon. gr. xij. (vel Liq. Potassæ ℥xxij.); Tinct. Aurantii Co. ʒj.; Spirit. Anisi ʒj.; Syrupi Zingib. ʒss. M. Fiat Haustus, bis terve quotidie sumendus.
- Form. 219. INFUSUM ANGELICÆ COMPOSITUM.
- R Fol. vel Rad. Angelicæ Arch. ʒij.; Rad. Serpenstar. ʒss.; Florum Sambuci Nig. ʒj.; Potassæ Carbonat. ʒij.; Aquæ lb ij. Macera per horas tres, et cola.
- R Liq. Colati ʒjss.; Spirit. Juniper. Comp. ʒj.; Tinct. Opil Co. ℥x. Fiat Haustus. (In Atonic Dropsy, &c.)
- Form. 220. INFUSUM ANTHEMIDIS COMPOSITUM.
- R Flor. Anthemidis ʒss.; Semin. Anisi cont. ʒij.; Fol. Menth. Virid. ʒss.; Caryoph. cont. ʒj.; Aurantii Cort. Sic. ʒij.; Aquæ Fervid. lb ʒss. Macera per horam, et cola.
- Form. 221. INFUSUM ARMORACIÆ COMPOS.
- R Sinapeos Semin. contus., Armoracæ Radicis concisæ, aa ʒij.; Aquæ Ferventis Oj. Macera per horam, et cola.
- R Liq. Colati ʒvij.; Spirit. Ammon. Arom. ʒjss.; Spirit. Pimentæ ʒij. M. Capiat Coch. ij. simpli, ter quotidie.
- Form. 222. INFUSUM ARNICÆ (PH. MIL. DAN.)
- R Flor. Arnicæ ʒj.; Flor. Anthemid. ʒss.; Herbe Menthæ Piper. ʒj.; Aquæ Fervidæ ʒx. Macera, et cola. (Dosis ʒj.—ʒjss.)
- Form. 223. INFUSUM ARNICÆ COMPOS.
- R Arnicæ Montan. Herbe, Summit. Artemis. Vulg., aa ʒss.; Herbe Centauræ Benedict., Rad. Calami Aromat., aa ʒij.; Aquæ Fervidæ ʒxvj. Macera per horas binas, et cola. Liq. colato adde Tinct. Aurantii, Spirit. Pimentæ, aa ʒss.; Spirit. Rorismarini ʒij. M. (Dosis ʒss.—ʒjss. bis terve in die.)
- Form. 224. INFUSUM ARTEMISIE VULGARIS Co.
- R Summit. Artemis. Vulgar. ʒvj.; Herbe Centauræ Bened. ʒij.; Aquæ Fervid. ʒxvj. Macera per horas binas, et cola. Liq. colato adde Spirit. Juniperi Comp. ʒj.; Olei Rorismarini ℥xij. M. (In Epilepsy from Exhaustion, Chlorosis, &c.)
- Form. 225. INFUSUM BARBERIS.
- R Barberia Corticis contusi ʒss.; Aquæ Ferventis O ss. Macera per horas binas in vase leviter clauso, et cola. (Dosis, ʒj. ad ʒij. bis ter quotidie; interdum cum Sodæ Carbonate, vel Potassæ Carbonate, vel Tinct. Calumbæ.)
- Form. 226. INFUSUM CALAMI AROMATICI.
- R Calami Radicis contusæ ʒij.; Aquæ Ferventis O ss. Macera per horas duas, et cola; dein adde Tinct. Calami ʒss.
- Form. 227. INFUSUM CALAMI AROMATICI COMPOSITUM.
- R Rad. Calami Arom. concisæ ʒjss.; Flor. Anthemid. ʒj.; Aurantii Cort. exsic. ʒj.; Caryoph. cont. ʒss.; Aquæ Ferventis O ss. Macera per quartam horam partem, et cola. Liquori colato adde Potassæ Carbon. ʒj.—ʒij.
- Form. 228. INFUSUM CARYOPHYLLI COMP.
- R Caryoph. contus. ʒj.; Cort. Aurantii Sic. ʒij.; Semin. Coriandri et Sem. Anisi cont., aa ʒss.; Aquæ Ferventis lbj. Macera per semi-horam, et cola.
- Form. 229. INFUSUM CINCHONÆ CUM QUINÆ SELPHATE.
- R Cinchonæ Cordifol. Corticis in Pulv. ʒvj.; Camphoratis Rosæ ʒjss.; Aquæ Ferventis Oj. Tere Lem, et digere per horas duas in vase clauso; deinde cola.
- R Liq. Colati ʒvj.; Sulphatis Quinæ gr. viij.; Assæ Sulphur. Diluti ℥xxiv. Fiat Mist., cuius Coch. ij. larga tertis vel quartis horis sumenda.
- Form. 230. INFUSUM CONIL.
- R Conil Fol. exsiccata ʒij.; Anisi et Coriandri Semin. contus. aa ʒjss.; Aquæ Ferventis O ss. Macera per horas duas, et cola. (Dosis ʒj. ad ʒij. tertia, quarta, et quinta ter in die.)
- Form. 231. INFUSUM DIOSMÆ CRENATÆ.
- R Fol. Diosmæ Crenatæ ʒss.; Aquæ Ferventis O ss. Macera per horas quatuor, et cola. (Dose ʒj.—ʒjss.)
- Form. 232. INFUSUM GENTIANÆ ALKALINUM COMPOS.
- R Radicis Gentianæ concisæ ʒij.; Corticis Aurantii Sic. ʒj.; Semin. Coriandri contus. ʒj.; Baccarum Rorismarini Cacumin. ʒj.; Potassæ Carbon. (vel Sodæ Carb.) ʒj.; Aquæ Ferventis ʒxij. Macera per horas duas, et cola.

- Form. 233. INFUSUM GUIACI COMPOSITUM.  
 R Guaiaci Ligni ras. lb. ss.; Glycyrrhizæ Radicis contusæ 3 j.; Sassafras Corticis Veræ concisæ 3 ss.; Coriandri Seminum contusorum 3 j.; Liquoris Calcis O vj. Infunde per dies tres, dein cola; cujus sumat mger quatuor sexve unciæ pro dose, et bis die repetatur. (SPRAGUE.)
- Form. 234. INFUSUM GLECHOMÆ HEDERACEÆ, CUM ACIDO HYDROCYANICO.  
 R Glechomæ Hederaceæ, vel Hederæ Terrestris, ʒss.—3vj.; Radicis Glycyrrhizæ ʒij.; Aquæ Ferventis Oj. Macera per horas tres, et cola.  
 R Liq. Colati ʒjss.; Acidii Hydrocyanici Mj.—ijj.; Syrupi Althææ Officinæ. ʒss. M. Fiat Haustus, sextâ vel octavâ quaque horâ sumendus.
- Form. 235. INFUSUM JUNIPERI.  
 R Juniperi Baccarum contusorum 3 ij.; Aquæ Ferventis Oj. Macera in vase leviter clauso per horas duas, et cola; dein adde, Spiritus Juniperi Compositi ʒj.; et insuper, pro re nata, Potassæ Bitartratis ʒjss. (Dosis, fluidunc. ij. ad iv. ter quaterve quotidè.)
- Form. 236. INFUSUM ET MISTURA JUNIPERI COMPOSITUM.  
 R Baccarum Junip. contus. ʒjss.; Semin. Anisi contus., Semin. Fœniculi cont., aa ʒjss.; Aquæ Ferventis Oj. Macera per horas tres; dein cola.  
 R Liq. Colati ʒijj.; Potassæ Nitratis ʒjss.; Sodæ Carbon. ʒjss.; Tinct. Scillæ ʒjss.; Spirit. Junip. Co. ʒjss.; Tinct. Opil Mxxv. Fiat Mist., cujus capiat Cyathum subindè.
- Form. 237. INFUSUM MARRUBII.  
 R Marrubii Herbæ exsic. ʒss.; Aquæ Destillatæ Ferventis O ss. Macera per horam, et cola.  
 R Liq. Colati ʒjss.; Tinct. Camphoræ Comp. ʒj.; Ext. Glycyrrh. gr. x. M. Fiat Haustus, in die sumendus. (Chronic Bronchitis, and Catarrh with inordinate Secretion.)
- Form. 238. INFUSUM MELISSÆ COMPOSITUM.  
 R Melissa Officinalis exsic., Radicis Glycyrrh. contusæ, aa ʒjss.; Sem. Anisi cont., Sem. Fœniculi, Sem. Coriand. cont., aa ʒss.; Aquæ Bullientis lb ij. Infunde per horam, et cola.
- Form. 239. INFUSUM MENTHÆ ET CARYOPHYLLI.  
 R Folior. Menthæ Virid. Sic. ʒij.; Rosæ Gallicæ Petal. Sic. ʒjss.; Caryophyllorum contus. ʒjss.; Aurantii Cort. Sic. ʒjss.; Aquæ Ferventis Oj. Macera per horam, et cola.
- Form. 240. INFUSUM MENTHÆ COMPOSITUM. (1.)  
 R Fol. Menth. Virid. exsic., Radicis Glycyrrh. concis. et cont., aa ʒss.; Semin. Anisi et Semin. Coriand. contus. aa ʒj.; Aquæ Ferventis q. s. ut fiat Colaturæ Oj. (Adde Magnæ et Sacch. Albuin pro terminibus Infantum; aut Interdum Acidii Sulphurici Arom. ʒj. pro nausea vel vomitu.)
- Form. 241. INFUSUM MENTHÆ COMPOSITUM. (2.)  
 R Menthæ Viridis exsicat. contusæ ʒjss.; Rosæ Gallicæ Petalorum exsicatiorum ʒj.; Aquæ Ferventis Oj.; Acidii Sulphurici Diluti ʒij.; Sacchari Purificati ʒjss. Menthæ et Rosæ Petalis superfunde Aquam cum Acidii dimidio mistam. Macera; dein Liquorem effunde, et Saccharum et Acidum reman. adde. (Dosis à fluidunc. j. ad ij. bis, ter, sæpiusve quotidè.)
- Form. 242. INFUSUM MENYANTHIS.  
 R Menyanthis Foliorum ʒss.; Zingiberis Radicis concisæ ʒij.; Aquæ Ferventis O ss. Macera in vase clauso per horas duas, et cola. (In doses of ʒj. to ʒjss., with Spiritus Ætheris Nitrici ʒj ad ʒij., in Rheumatism, Arthritic Affections, and in Cachectic and Cutaneous Diseases.)
- Form. 243. INFUSUM MILLEFOLII COMPOSITUM.  
 R Herbæ Millefolii ʒij.; Herbæ Rorismarini, Herbæ Thymi Vulg., aa ʒj.; Semin. Coriand. cont. ʒj.; Aquæ Ferventis lbj. Infunde per horam, et cola.  
 R Liquoris Colati ʒjss.; Spirit. Rorismarini ʒss.; Tinct. Aloes Comp ʒj.—ʒij. Fiat Haustus, primo mane quotidè capiendus. (In Chlorosis, Amenorrhœa, &c.)
- Form. 244. INFUSUM PECTORALE. (1.)  
 R Herbæ Malvæ Off., Herb. Tussilag., Radicis Althææ, Rad. Glycyrrh., aa ʒj.; Semin. Anisi ʒss.; Aquæ Fervid. quantum velis. Macera.
- Form. 245. INFUSUM PECTORALE. (2.)  
 R Rad. Althææ, Herbæ Melissa, Herbæ Menthæ Viridis, Flor. Sambuci, Flor. Arnicæ, aa ʒj.; Semin. Anisi ʒss. M. Sint loco Theæ.
- Form. 246. INFUSUM QUASSIÆ COMP.  
 R Radicis Calumbæ concisæ ʒj.; Ligni Quassiæ ʒjss.; Aquæ Ferventis q. s. ut sint Colaturæ ʒjss.; adde Zinci Sulphatis gr. iv.; Acidii Sulphur. Arom. ʒj.; Tinct. Aurantii Co. ʒij. M.
- Form. 247. INFUSUM QUASSIÆ CUM AQUA CALCIS.  
 R Ras. Lign. Quassiæ ʒss.; Aquæ Calcis Vivæ ʒvj. Stent in digestionem per horas xxiv.; cola, et adde Aquæ Menth. Virid. ʒij.; Syrupi Aurantii ʒss. M.
- Form. 248. INFUSUM RHATANIÆ.  
 R Krameris Radicis contusæ ʒij.; Aquæ Ferventis O ss. Macera per horas sex in vase leviter clauso, et liquorem cola.
- Form. 249. INFUSUM RHEI.  
 R Rhei Radicis concisæ ʒjss.; Aquæ Ferventis O ss. Macera Radicem per horas duas in vase leviter clauso, et cola; dein adde Sacchari Albissimi ʒij.; Olei Menthæ Viridis gtt. viij. solutus in Spiritu Menthæ Piperitæ, ʒj. Tunc misceatur.
- Form. 250. INFUSUM RHEI ALKALINUM.  
 R Rhei Rad. concisæ et contusæ ʒij.; Potassæ Carbon. ʒj.; Aquæ Fervid. O ss. Macera per horas quatuor, cola, et adde Tinct. Cinnam. ʒss.
- Form. 251. INFUSUM RHEI ALKALINUM.  
 R Infus. Rhei ʒvij.; Potassæ Carbon. ʒjss.; Tinct. Sennæ, et Syrupi Sennæ, aa ʒijss. M.
- Form. 252. INFUSUM RHEI COMP.  
 R Rhei Rad. concis. et contus. ʒss.; Cort. Canellæ Albæ cont. ʒij.; Flor. Anthemid., Corticis Aurantii, aa ʒijj.; Semin. Fœniculi cont., Sem. Coriandri cont., aa ʒj.; Aquæ Ferventis lbjss. Macera per horas quatuor, et cola. Liquori colato adde Potassæ Carbon. ʒij.; Tinct. Cinnam. ʒj. M.
- Form. 253. INFUSUM ROSÆ ET AURANTII COMP.  
 R Rosæ Gallicæ Petal. Sic. ʒij.; Aurantii Cort. exsic. ʒij.; Limonis Cort. Recent. ʒj.; Caryophyl. contus. ʒjss.; Aquæ Ferventis Ojss. Macera per horam, et cola. Liquori colato adde Sacchar. Albi ʒj.
- Form. 254. INFUSUM RUTÆ COMP.  
 R Herb. Rutæ, Flor. Anthemid., Radicis Calami Arom., aa ʒij. Macera cum Aquæ Fœniculi ʒx., per horas tres, et cola. Liq. colato adde Camphoræ ʒj.; prius in Macilug. Acaciæ q. s. solutæ; Spirit. Æther. Nit. ʒss. M.
- Form. 255. INFUSUM SALVIÆ COMPOSITUM.  
 R Herbæ Salviæ, Semin. Sinapeos, aa ʒss.; Aquæ Fervid. lbj. Macera per horam, et cola. Liq. colato adde Spiritus Armoracæ Comp. ʒij. M. Capiat Coch. ij.—ijj. ter quaterve in die.
- Form. 256. INFUSUM SAMBUCI CUM ANTIM. TART.  
 R Flor. Sambuci ʒj.; Aquæ Fervid. q. s. ut sit Colat. ʒvj.; cui adde Oxymel. Simplicis, Oxym. Scilliticæ, aa ʒj.; Antimonii Pot.-Tart. gr. ij. M. Capiat Coch. j. omni horâ. (AUGUSTIN.)
- Form. 257. INFUSUM SANTONICÆ SEMINUM COMPOSITUM.  
 R Semin. Artem. Santonicæ cont., Rad. Valeriane Opt., aa ʒss. Infunde in vase clauso cum Aq. Fervidæ ʒix.; cola, et adde Aquæ Menth. Virid. ʒij.; Extr. Rutæ ʒj.; Tincturæ Valerianæ Compositæ ʒij. M. Capiat ʒss.—ʒjss. pro dose. (In Hysteria, Chlorosis, Amenorrhœa, Worms, &c.)
- Form. 258. INFUSUM SARZÆ ALKALINUM.  
 R Sarzæ Radicis concisæ et contusæ ʒiv.; Glycyrrhizæ Radicis contusæ ʒj.; Liquoris Calcis O iv. Macera per horas xxiv. in vase benè clauso, sæpe agitando.
- Form. 259. INFUSUM SENEGÆ ET SERPENTARIÆ COMP.  
 R Rad. Senegæ, Rad. Serpentariæ, aa ʒss.; Aquæ Fervid. Oj. Macera in vase clauso per horam, et cola. Liq. colato adde Camphoræ ʒss.; prius solute in Ætheris Sulphurici ʒij.; Aquæ Cinnam. ʒj.; Syrupi Althææ, et Syrupi Papaveris, aa ʒss. M. Capiat Cochlearia lbj. larga, atis horis. (HECKER.)

## Form. 260. INFUSUM SENNÆ COMPOSITUM.

R Sennæ Foliorum 5 ss.; Coriandri Seminum contus. ʒj.; Zingiberis Rad. contus. ʒj.; Extracti Glycyrrhizæ ʒjss.; Aquæ Ferventis O ss. Macera per horam in vase leviter clauso, et Liquorem cola.

## Form. 261. INFUSUM SENNÆ CUM MANNA.

R MANNÆ ʒij.; Fol. SENNÆ ʒjss.; POTASSÆ Bitart., Seminum Anisi contus., aa ʒjss.; Semin. Coriand. Sat. contus. ʒjss.; Aquæ Ferventis O ij. Infunde per horas quatuor, et cola.

## Form. 262. INFUSUM SERPENTARIÆ COMPOSITUM.

R Serpentariæ Radicis, Contrayervæ Radicis, singulorum contus., ʒij.; Aquæ Ferventis O ss. Post macerationem in vase aperto per horas duas, Liquorem cola, et adde Tinct. Serpentariæ ʒss. vel ʒj. — (Cum Liq. Ammon. Acet. &c.)

## Form. 263. INFUSUM ET HAUSTUS SCOPARI COMPOSIT.

R Scoparii Cacum. concis. ʒj.; Marrubii Vulgar. Fol. ʒss.; Aq. Ferventis Ojss. Macera per horam, et cola.

R Infusi Colati ʒxj.; Spirit. Æther. Nit. ʒss.; Spirit. Juniperi Comp. ʒj. Fiat Haustus, ter quaterve quotidie sumendus.

## Form. 264. INFUSUM SPIGELLÆ COMPOSITUM.

R Spigellæ Radicis concis. ʒss.; Sennæ Folior. ʒij.; Aurantii Corticis conc., Santonice Seminum contus., Foeniculi Semin. contus., aa ʒj.; Aquæ Ferventis ʒxij. Macera per horas duas in vase leviter clauso, et cola. (Dosis, Cyathus Vinosus singula auroris, jejuno ventriculo. — In Lumbriis. SPRAGUE.)

## Form. 265. INFUSUM TILLÆ COMPOSITUM.

R Florum Tillæ Europ. ʒss.; Rad. Althææ Officin. ʒij.; Flor. Aurant. ʒij.; Aquæ Ferventis ʒij. Macera per horam; exprime, et cola.

## Form. 266. INFUSUM ET MISTURA TONICO-APERIENS.

R Sennæ Foliorum ʒjss.; Gentianæ Radicis concis. ʒij.; Aurantii Corticis exsic. ʒjss.; Limonis Corticis Recentis ʒijss.; Semin. Coriandri contus. ʒjss.; Zingiberis Rad. concisæ ʒjss.; Aquæ Ferventis O ij. Macera bene in vase clauso per noctem integram (vel per horas octo); exprime bene, et cola. Liq. colato adde Magnesiam Sulphatis, Tinct. Cardamom. Comp., aa ʒij.; Spirit. Vini Rect. ʒij. M. (Dosis ʒj.—ʒjss. pro re natâ.)

## Form. 267. INFUSUM UVÆ URSI.

R Uvæ Ursi Folior. ʒij.; Aquæ Ferventis O ss. Macera in vase clauso per horas tres, prope ignem, et cola. (With the Alkaline Carbonates in Nephritic Cases, &c.; and with the Mineral Acids, &c. in Affections of the Air Passages.)

## Form. 268. INFUSUM VALERIANÆ.

R Valerianæ Radicis contusæ ʒss.; Aquæ Ferventis ʒxij. Macera in vase clauso per horas duas. Liquori colato adde Tinct. Lavandulæ Compositæ, Syrupi Aurantii, aa ʒss. (Dosis, fluidunc. ij. ter quaterve quotidie.)

## Form. 269. INFUSUM VALERIANÆ COMPOSITUM.

R Radicis Valerianæ, Rad. Calami Aromatici, aa concis. et cont., ʒss.; Flor. Arizicæ Montanæ ʒij.; Aquæ Ferventis ʒxvj.; Liguoris Potassæ ʒj. Macera per horas duas vel tres; exprime, et adde Ætheris Sulphur. ʒij.; et Interdum Tinct. Lavandul. Comp. ʒij., vel Extr. Rutæ vel Extr. Taraxaci ʒij. M. (Dosis ʒss.—ʒjss. ter quaterve in die.)

## Form. 270. INFUSUM VALERIANÆ ET SERPENTARIÆ COMP.

R Rad. Valerianæ, Rad. Serpentariæ, Flor. Sambuci Nig., aa ʒij.; Aquæ Fervid. ʒix. Macera per horas duas, et cola. Liq. colato adde Acidul Sulph. Arom. ʒjss.; Syrupi Papaveris ʒss. M. (Fever, Hysteria, and other Nervous Affections.)

## Form. 271. INFUSUM ZINGIBERIS.

R Zingiberis Radicis concisæ ʒjss.; Aquæ Ferventis O ss. Macera per horas duas in vase leviter clauso, et cola; tum adde Tincturæ Zingiberis, Syrupi ejusdem, aa ʒss. (This is the best vehicle for giving the Liquor. Ferri Oxygenati, and it is also a very grateful aromatic in cases of Flatulency.)

## Form. 272. INJECTIO ACETI PYROLIGNÆ.

R Acidi Pyrolignæ, part. j.—ij.; Mist. Camphoræ, Aq. Rosæ, aa part. ij.—ij.; Tinct. Camphoræ Co. part. ss.—j.

## Form. 273. INJECTIO ARGENTI NITRATIS.

	No. 1.	No. 2.	No. 3.
R Argenti Nitratis	- ʒj.	ʒij.	ʒij.
Aquæ Destillatæ	- ʒij.	ʒij.	ʒij.
Solve.			

## Form. 274. INJECTIO ASTRINGENS.

R Infusi Quercus, ut suprâ, ʒiv.; Pulv. Gallarum gr. xxx.; Tinct. Catechu ʒij. Fiat Mist., ex quo injicitur pauxillum, vel per vaginam vel per anum, pro Leucorrhœa, vel Sanguinis Fluxu.

## Form. 275. INJECTIO BORACICÆ.

R Aquæ Rosæ ʒiv.; Aq. Flor. Aurantii ʒij.; Bi-boratis Sodæ ʒj.; Tinct. Camphoræ Comp. ʒij.—ʒss. M. Fiat Injectio.

## Form. 276. INJECTIO ZINCI ACETATIS COMPOSITA.

R Zinci Sulphatis, Plumbi Acet., aa ʒss.; Camphoræ ʒss.; Opii ʒij. Solve in Aquæ Bullientis Oj.; cola, et fiat Injectio, ter quaterve in die utendâ; phiala agitata.

## Form. 277. IODIDUM HYDRARGYRI.

(Internally, in doses of from one grain to three, and externally in ointments. — (Vide Unguent. Iod. Hyd.) For the best account of the preparations and uses of Iodine, consult Dr. O'Shaughnessy's translation of Lagol on Scrofula.)

## Form. 278. IODIDUM PLUMBI.

(Internally, in doses of from half a grain to five grains; and externally. — (Vide Ung. Iod. Plumbi.)

## Form. 279. JULEPUS SEDATIVUS.

R Camphoræ gr. vj.; Spirit. Æther. Sulphur. Comp. ʒjss.; Potassæ Nitratis gr. xij.; Aquæ Flor. Aurantii ʒij.; Syrupi Althææ ʒij.; Syrupi Papaveris ʒij. M. Fiat Mist., cujus capiat tertiam partem unci horæ, vel bihorio. (PIERQUIN.)

## Form. 280. LINCTUS ACIDI HYDROCHLORICI.

R Mellis Rosæ ʒx.; Acidi Hydrochlorici ʒij.; Syrupi Rheodæ ʒij. M. Simul agita, ut fiat Linctus.

## Form. 281. LINCTUS BORACICÆ.

R Cetacel ʒjss.; Pulv. Tragacanthæ Comp. ʒij.; Syrupi Tolutani ʒj.; Bi-boratis Sodæ ʒjss.; Confect. Rosæ ʒv.; Syrupi Althææ ʒj. vel q. s. Fiat Linctus, de quo lambat pauxillum sæpè. (Sore Throat, Œsophagitis, &c.)

## Form. 282. LINCTUS CAMPHORACÆ.

R Camphoræ gr. xij.; Pulv. Gum. Acetiæ ʒj.; Syrupi Althææ ʒij. Miscè bene. (NIEMANN.)

## Form. 283. LINCTUS CHLORURETI CALCIS.

R Chlorureti Calcis gr. ij.; solve in Aq. Destill. ʒj.; et adde Mellis ʒjss. M. Capiat infans Cochlear usum minimum subindè. (In Softening of the Digestive Mucous Surface.)

## Form. 284. LINCTUS DEMULCENS. (1.)

R Olei Amygdal. Dul. Syrupi Althææ, aa ʒij.; Syrupi Papaveris ʒxj.; Vini Ipecacuanhæ ʒjss.; Vitis Ovi unius. M. Fiat Linctus.

## Form. 285. LINCTUS DEMULCENS. (2.)

R Cetacel ʒjss.; Pulv. Tragacanthæ Comp. ʒjss.; Syrupi Papaveris et Syrupi Tolutani, aa ʒjss.; Potassæ Nitratis ʒij.; Confect. Rosar. ʒvj.; Syrupi Simp. q. s. ut fiat Linctus, de quo lambat pauxillum pro re natâ.

## Form. 286. LINCTUS DEMULCENS ET APERIENS.

R Syrupi Violæ ʒijss.; Olei Amygdal. Dul. ʒj.; Syrupi Scillæ et Syrupi Sennæ aa ʒss. M. Fiat Linctus. (Infantibus.)

## Form. 287. LINCTUS EMOLLIENS (BRENDÉLLI).

R Saponis Venet. ʒiv.; solve in Olei Amygdal. Dulcis ʒjss.; Manna Purificatæ ʒss.; Potassæ Bitart. ʒj.; Syrupi Althææ ʒj. M. Fiat Linctus.

Form. 288. LINCTUS MYRRHÆ ET IPECACUANHÆ.

- R Myrrhæ G. R. ʒj.; Pulv. Ipecacuan. gr. vj.; Oxymel. Scillæ, Mucilag. Acaciæ, Syrupi Althææ, aa ʒvj. Fiat Linctus, de quo lambat pauxillum sæpè.

Form. 289. LINCTUS OLEOSUS. (1.)

- R Olei Amygdalarum, Syrupi Mori, aa ʒjss.; Confect. Fruct. Rosæ Caninæ ʒij.; Pulv. Tragacanthæ Comp. ʒij. Miscæ. Cochleare minim. subindè deglutatur.

Form. 290. LINCTUS OLEOSUS. (2.)

- R Olei Olivæ ʒjss.; Oxymellis Scillæ, Syrupi Papaveris, aa ʒj. Dosis, Cochleare parv. j. urgenti Tusse. (In common Catarrhal Cough, with Sore Throat.)

Form. 291. LINCTUS OPIATUS.

- R Syrupi Papaveris ʒij.; Mucil. Acaciæ Ver. ʒjss.; Conf. Fruct. Rosæ Caninæ, ʒj.; Acidi Sulph. Diluti ʒij. Miscæ. Dosis, Cochleare minim. subindè.

Form. 292. LINCTUS OPIATUS CUM SCILLA.

- R Syrupi Papaveris, ʒij.; Syrupi Mori ʒvj.; Syrupi Limonis ʒss.; Oxymellis Scillæ, ʒss. Miscæ. Dosis, Cochleare minim. Tusse urgenti.

Form. 293. LINCTUS PECTORALIS.

- R Pulv. Sem. Anisi, Pulv. Sem. Fœniculi, Extr. Glycyrrh., aa ʒss.; Pulv. Sem. Carui ʒij.; Potassæ Nitratis ʒj.; Ol. Anisi ʒss.; Syrupi Althææ ʒvss. M. Fiat Linctus. Capiat ʒj. pro re natâ.

Form. 294. LINCTUS POTASSÆ NITRATIS.

- R Potassæ Nitratis contr. ʒjss.; Mellis Rosæ ʒj.; Oxymellis Simplicis ʒjss. M. Capiat Coch. minim. pro re natâ.

Form. 295. LINIMENTUM AMMONIÆ CUM OLEO TERE-  
BINTHINÆ.

- R Liqueoris Ammoniac ʒss.; Olei Olivæ ʒj.; Olei Terebintinæ ʒss.; Olei Limonis ʒss. Agita simul donec misceantur.

Form. 296. LINIMENTUM AMMONIÆ ET TERE-  
BINTHINÆ COMP.

- R Liqueoris Ammon. ʒj.; Olei Olivæ ʒij. Miscæ benè, et adde Tinct. Camphoræ ʒij.; Olei Terebint. ʒij.; Saponis Duri ʒv. Miscæ benè, dein adde, Olei Cajuputi ʒj.; Olei Limonis ʒjss. M.

Form. 297. LINIMENTUM ANODYNUM. (1.)

- R Opii ʒj.; Camphoræ ʒij.; Liq. Ammoniac ʒiv.; Saponis Duri ʒiv.; Olei Terebintinæ ʒviij.; Olei Limonis ʒss.; Spirit. Rorismarini et Spir. Lavandul. aa ʒxij. Miscæ.

Form. 298. LINIMENTUM ANODYNUM. (2.)

- R Linimenti Saponis Comp. ʒj.; Liqueoris Ammoniac, ʒij.; Olei Caryophylli ʒj.; Tincturæ Opii ʒss. M. Fiat Linimentum.

Form. 299. LINIMENTUM CAMPHORÆ FORTIUS.

- R Camphoræ rasæ ʒijss.; solve in Tinct. Cantharidis ʒij. et Tinct. Capsici Anni ʒjss.; dein adde Linimenti Saponis Comp. ʒss.; et gradatim, miscendo, Liqueoris Ammoniac ʒvj.; Olei Olivæ ʒxj. M. Fiat Linimentum, cum quo illinatur pars affecta bis terve quotidè.

Form. 300. LINIMENTUM CANTHARIDUM COMP.

- R Tinct. Cantharid. ʒij.; Olei Terebint. ʒj.; Ammoniac Liq. ʒjss.; Saponis Duri ʒj.; Olei Cajuputi ʒss. M. Fiat Linimentum. (Altered from AUGUSTIN.)

Form. 301. LINIMENTUM FERRIFUGUM.

- R Antimonii Potassio-Tartratis gr. xxxv.; solve in Aquæ Destill. ʒij. vel q. s.; deinde terè benè cum Adipis Præpar. ʒj., et fiat Linimentum. (The antimony is partially absorbed without producing any Phlogosis.)

Form. 302. LINIMENTUM IODINI.

- R Linimenti Saponis Co. ʒj.; Iodini gr. viij. vel x. Miscæ.

Form. 303. LINIMENTUM PHOSPHORATUM.

- R Olei Olivarum Optimali ʒviij.; Phosphori excelsi gr. xx. Solve cum calore, cola ex frigidis, et fiat Linimentum. (In Paralyse locale, Marasmo, Rheumatismo, et Arthritide Chronico.)

Form. 304. LINIMENTUM PYRETHRI.

- R Tincturæ Pyrethri ʒvj.; Linimenti Camphoræ ʒiv.; Liqueoris Ammoniac ʒij. Miscæ. Fiat Linimentum.

Form. 305. LINIMENTUM RUBEFACIENS.

- R Camphoræ ʒj.; Olei Olivæ et Liq. Ammon. aa ʒj.; Olei Macis ℥xxxv. Miscæ. (Externally to parts in deep-seated Inflammation.)

Form. 306. LINIMENTUM SAPONIS ET CAMPHORÆ COMP.

- R Saponis Med. ʒj.; Alcoholis Rect. ʒvj.; Camphoræ et Aquæ Destill. aa ʒj. Solve leni cum calore, et adde Olei Rorismarini ʒiv.; Olei Thymi ʒij.; Liqueoris Ammoniac ʒij. Miscæ benè.

Form. 307. LINIMENTUM CONTRA SPASMOS.

- R Olei Olivæ, Olei Terebintinæ, Liqueoris Ammoniac, Tinct. Opii, Linimenti Saponis Compositi, aa ʒss. Fiat Linimentum.

Form. 308. LINIMENTUM STIMULANS.

- R Linimenti Camphoræ Compositi, Linimenti Saponis Compositi, aa ʒjss.; Olei Crotonis ʒj.; Olei Cajuputi ʒjss. Fiat Linimentum.

Form. 309. LINIMENTUM SULPHURO-SAPONACEUM.

- R Potassii Sulphuret ʒij.; Saponis Albi, Olei Olivæ, aa lbj.; Olei Volat. Thymi ʒj. M. (JADELOT.)

Form. 310. LINIMENTUM TABACI.

- R Tabaci Foliorum ʒj.; Axungie Porcinæ lbj. Simul liquefac et macera prope ignem donec friabilia sint folia; tunc exprime. (Ph. Amst.)

Form. 311. LINIMENTUM TERE-  
BINTHINÆ COMP.

- R Linimenti Saponis Co., Linimenti Camphoræ Co., aa ʒjss.; Olei Terebint. ʒij.; Saponis Duri ʒij.; Olei Limonis et Ol. Cajuputi ʒj.—ʒij. M. Fiat Linimentum.

Form. 312. LINIMENTUM TERE-  
BINTHINO-PHOSPHORATUM.

- R Olei Terebint. ʒij.; Camphoræ rasæ ʒij.; Linimenti Ammon. Fort. ʒij.; Saponis Medicin. ʒij.; Phosphori Puri gr. x.—xij. prius soluti in Olei Cajuputi, vel in Olei Caryophyl. ʒij. vel q. s. M. (In Chronic Rheumatism and Epidemic Cholera.)

Form. 313. LINIMENTUM THERIACUM COMPOSITUM.

- R Opii Puri ʒij.; Camphoræ, Succini, aa ʒss.; Spirit. Vini ʒvj. Miscæ pro Linimento.

Form. 314. LINIMENTUM VOLATILE.

- R Olei Olivæ ʒiv.; Camphoræ ʒij.; Liqueoris Ammoniac ʒij. Miscæ.

Form. 315. LIQUOR ACETATIS MORPHIÆ.

- R Morphicæ Acetatis gr. xvj.; Aquæ Destillatæ ʒviij.; Acidi Aceticii ℥x.; Spirit. Pimentæ ʒv. Solve. (Dosis a ℥v. ad ℥xxx.)

Form. 316. LIQUOR ANTIMONII POTASSIO-TARTRATIS.

- R Antimonii Potassio-Tartratis gr. xxxij.; Aquæ Destillatæ ʒxiv.; Spiritus Rectificat. ʒij.; Uvarum Passarum, demptis acinis, ʒij. Macera per hebbomadam, et cola.

Form. 317. LIQUOR BALSAMICO-AROMATICUS. — Balsamum Fite Hoffmanni.

- R Balsami Peruviani ʒj.; Olei Succini, Olei Intæ, Olei Rorismarini, Olei Lavand., Olei Caryoph., Olei Pimentæ, aa ʒss.; Spirit. Vini Rectificati ʒxjss. Miscæ benè. (In doses of from 10 to 30 drops on Sugar, or in a suitable vehicle.)

Form. 318. LIQUOR BI-BORATIS SODÆ COMP.

- R Bi-boratis Sodæ, Potassæ Bihart., aa ʒss.; Aquæ Destill. O. (Dosis ʒj.—ʒij. pro Infantibus; et ʒss.—ʒij. ter die pro Adultis.)

Form. 319. LIQUOR CALCHæ CHLORIDI (BEDDOES.)

- R Acidi Hydrochlorici, Aquæ Destillatæ, aa ʒiv.; Marmoris Albi Pulv. q. s. ad saturandum.

## Form. 320. LIQUOR CAMPHORÆ ÆTHEREUS.

R Camphoræ rasæ ʒj.; Ætheris Sulphurici ʒj. Solve, Capiat ℥xx.—xl. super Saccharum vel in Vinî Hispan. Cyatho. (Proposed by BANG, and adopted in most of the Continental Pharm.)

## Form. 321. LIQUOR FERRI OXYGENATI. (BEDDOES.)

R Ferri Sulphatis ʒ ss.; Acidi Nitrici Fortissimi (per pond.) ʒ ss. Tere probè simul in mortario vitreo donec effervescentia peracta; dein adde gradatim Aquæ Destillatæ ʒjss. Postea per chartam cola. Dosis à quatuor ad decem guttas, ter quaterve, quotidie, in Quassia, vel Zingiberis, vel Caryophylli, Infusione. (In Worms, Hæmorrhages, &c.)

## Form. 322. LIQUOR HYDRARGYRI BICHLORIDI.

R Hydrargyri Bichloridi gr. iv.; Acidi Hydrochlorici ℥j. vj.; Aquæ Destillatæ ʒj.; Spirit. Tenuioris ʒvj.; Tincturæ Croci ʒij. Tere probè simul in mortario vitreo ut fiat Solutio. Incip. sumendo ℥xx. nocte manequè ex haustu Infusûs Lini, vel Decocti Glycyrrhizæ; posteaque pro re natâ augeatur. (SPRAGUE.)

## Form. 323. LIQUOR POTASSII IODIDI.

R Potassii Iodidi gr. xxiv.; Aquæ Destillatæ ʒj. Solve terendo in vase vitreo. (Dosis ℥x.—xxx.)

## Form. 324. LIQUOR POTASSII IODIDI IODURETUS.

R Potassii Iodidi gr. xxxvj.; Iodini gr. x.; Aquæ Destillatæ ʒx. Solve terendo in vase vitreo. (In doses of 10 drops to 30, thrice daily.)

## Form. 325. LIQUOR MORPHIÆ CITRATIS.

R Morphiæ Puræ gr. xvj.; Acidi Citrici Crystal. gr. viij.; Aquæ Destil. ʒj.; Tinct. Cocci q. s. Solve. (Dosis ℥v.—xxv.)

## Form. 326. LIQUOR PLUMBI ACETATIS DILUTUS.

R Liquor Plumbi Acetatis, ʒj. ad ʒij.; Acidi Acetici Diluti ʒij.; Spirit. Rectificati ʒjss.; Aquæ Destillatæ ʒxiv. Miscæ.

## Form. 327. LIQUOR POTASSÆ CHLORATIS.

R Potassæ Chloratis ʒj.; Aquæ Destillat. ʒxij. (In indolent Sores as a Lotion, and internally in three times its bulk of vehicle.)

## Form. 328. LIQUOR POTASSII IODIDI IODURETUS CONCENTRATUS. (LUGOL.)

R Iodolli ʒj.; Potassii Iodidi ʒij.; Aquæ Destillat. ʒvj. Solve. (This solution contains one twenty-fourth part of Iodine. Dose for an Adult, six drops in sugared Water in the morning fasting, and six an hour before dinner; increasing the dose, every week, two drops, until it reaches to thirty or thirty-six daily.)

## Form. 329. LIQUOR POTASSII IODIDI IODURETUS DILUTUS. (LUGOL.)

	No. 1.	No. 2.	No. 3.
R Iodini - - -	gr. ʒ	gr. j.	gr. j. ʒ
Potassii Iodidi - -	gr. jss.	gr. ij.	gr. ijs.
Aquæ Destillatæ -	ʒ viij.	ʒ viij.	ʒ viij.

Solve.

## Form. 330. LIQUOR ZINCI ACETATIS.

R Zinci Sulphatis Purif. gr. xxiv.; Aquæ Destillatæ ʒiv. Solve.

R Plumbi Acetatis gr. xxxij.; Aquæ Destillatæ ʒiv. Solve. Misceantur Solutiones; quiescant paulisper; dein coletur *Liquor*.

## Form. 331. LOTIO ACIDI HYDROCYANICI.

R Acidii Hydrocyanici ʒ ss.; Spiritûs Rectificati, ʒj.; Aquæ Destillatæ, ʒxss. Miscæ, et fiat Lotio, diligenter utenda.

## Form. 332. LOTIO ANTIPHLOGISTICA.

R Liguoris Plumbi Diacetatis ʒvj.; Liguoris Ammoniac Acetatis ʒiv.; Aquæ Puræ ℥ij. Miscæ.

## Form. 333. LOTIO ANTISPORICA.

R Potassii Sulphureti ʒiv.; Aquæ Oj.; Acidi Sulphurici ʒiv. Miscæ. Fiat Lotio, bis terve quotidie utenda. (DUFUYTREN.)

## Form. 334. LOTIO BORACICA.

R Bi-boratis Sodæ ʒj.; Aq. Rosæ, Aq. Flor. Aurantii- ʒâ ʒij. M. Fiat Lotio.

## Form. 335. LOTIO EVAPORANS.

R Ætheris Sulphur., Liquor. Ammon. Acet., Spirit. Vini Rect., ʒâ ʒjss.; Aquæ Rosæ ʒijss. M. Fiat Lotio.

## Form. 336. LOTIO EVAPORANS ASTRINGENS.

R Ammoniac Hydrochloratis ʒij.; Liguoris Ammoniac Acet. ʒij.; Aquæ Puræ ʒxij. Miscæ.

## Form. 337. LOTIO FLAVA.

R Hydrargyri Bichloridi gr. xv.; Liguoris Calcis ʒj. Miscæ.

## Form. 338. LOTIO HYDRARGYRI CAMPHORATA.

R Hydrargyri ʒj.; Acidi Nitrici ʒij.; Aquæ Destil. O v. Hydrargyrum digerè cum Acido Nitrico, et Aquam Destillatam adde, dein Camphoræ ʒ ss. ad ʒijss adde. (In Chronic Cutaneous Affections, applied twice daily.)

## Form. 339. LOTIO SEDATIVA.

R Acidii Hydrocyanici ʒj.—ʒij.; Mist. Amydal. Amaræ ʒvjss.; Hydrarg. Bichloridi gr. ij.—v. Fiat Lotio, ope spongiæ partibus affectis applicanda.

## Form. 340. LOTIO TEREBINTHINÆ ET CAMPHORÆ.

R Camphoræ ʒiv.; Spirit. Vini Rect., Olei Terebinthinæ, ʒâ ʒiv. M. Fiat Lotio, in Mortis Cutaneis Chronicis utenda.

## Form. 341. LOTIO TEREBINTHINATA.

R Olei Terebinthinæ, Alcoholis, ʒâ ʒiv.; Camphoræ ʒvj. Fiat Lotio. (In Pityriasis, &c.)

## Form. 342. MISTURA ACETATIS MORPHIÆ.

R Morphiæ Acetatis gr. ij.; Acidi Acetici ʒss.; Mist. Camphoræ ʒvss.; Tinct. Humuli ʒij.; Syrupi Tulutani ʒj. M. Fiat Mist., cujus capiat Cochlearium unum amplum tertiat vel quartâ quaque horâ.

## Form. 343. MISTURA ACIDI BORACICI.

R Acidii Boracici ʒj.; Mist. Camphoræ ʒiv.; Syrupi Aurantii ʒj. M. Capiat Cochlearia ij. 2â vel 2ââ quaque horâ. (In Cerebral Affections. CHAUSSE.)

## Form. 344. MISTURA ACIDI HYDROCYANICI COMP.

R Acidii Hydrocyanici ℥viij.—xx.; Vini Ipecacuanhæ ʒij.; Spirit. Ætheris Sulphurici Comp. ʒij.; Mist. Camphoræ, Mist. Amygdal. Dulc., ʒâ ʒijss.; Oxymellis Selliæ ʒij.—ʒss. M. Capiat Cochlear. j. vel ij. vel ij. ter quaterve quotidie.

## Form. 345. MISTURA ACIDI HYDROCHLORICI.

R Acidii Hydrochlorici ʒj.; Decocti Hordei Oj.; Sacchari Purificati, ʒss. Miscæ. (Dosis à fluidunc. ij. ad iv. bis, ter, sæpiusve quotidie.)

## Form. 346. MISTURA ACIDI NITRICI COMP.

R Extracti Hyoscyami ʒss.; Acidi Nitrici Diluti ʒj.; Aquæ Destillatæ ʒvss. Syrupi Zingiberis ʒss. M. Fiat Mistura. (Dosis unc. j. secundis horis, durante paroxysmo.)

## Form. 347. MISTURA ALKALINA ANODYNA.

R Tincturæ Opil ʒij.; Liguoris Potassæ ʒss.; Sybillis Myrsinæ ʒss.; Aquæ Puræ ʒxjss. Miscæ. (Dosis à ʒj. ad ʒij. bis terve in die.)

## Form. 348. MISTURA ALKALINA CARDIACA.

R Mist. Camph. ʒvjss.; Sodæ Carbon. ʒjss.; Ammon. Sesquicarbon. ʒj.; Tinct. Calomelæ ʒss.; Spirit. Anis. Tinct. Cardamom. Co., ʒâ ʒss. M. Capiat Cochlearia ij. magna, bis terve quotidie.

## Form. 349. MISTURA ALDES ET GUAIACI COMP.

R Tincturæ Aloës Comp., Tinct. Guaiaci, Spirit. Ammoniac Aromat., ʒâ ʒss.; Tinct. Ferri Ammonio-Chloridi ʒij. M. Capiat ʒj. vel ʒij. ter de die, in vehiculo quovis idoneo.

## Form. 350. MISTURA AMMONIACI COMP. (1.)

R Mist. Ammoniaci ʒvjss.; Potassæ Nitratæ ʒj.; Aceti Scillæ ʒij.; Spirit. Junip. Comp. ʒj.; Tinct. Opil ℥xij. Fiat Mist., cujus capiat Cochlearium amplum ʒijss vel 4tis horis.

## Form. 351. MISTURA AMMONIACI COMPOSITA. (2.)

R Gummi Ammoniaci ʒj.; Oxymellis Selliæ ʒj.; Vini Ipecacuanhæ ʒj.; Aquæ Flor. Sambuci ʒivss.; Syrupi Papaveris ʒij. M. Capiat æger quilibet horâ Cochlearium unum. (Chronic Pectoral Complains.)

Form 352. MISTURA AMMONIÆ HYDROCHLORATIS.

- R Hydrochloratis Ammoniae, Extr. Glycyrrh., aa 3 j.; Decocti Althææ 3 vj.; Oxy mel. Simp. 3 j. (vel Oxy mel. Scillæ.) M. (Catarrhal Affections.)

Form 353. MISTURA ANODYNA.

- R Magnesie Carbon. 3 jss.; Tinct. Humul. 5 iij.; Aq. Ment. Virid. 3 iij.; Infusi Caryophyl. 3 iijss. M. Fiat Mist., cujus capiat Cochlearia ij. larga pro re nata, vel urgenti Nauseâ.

Form 354. MISTURA ANODYNA. — (Infantilis.)

- R Testæ Preparatæ 5 ij.; Syrupi Papaveris Alb. 3 j.; Spiritus Ammon. Fœtid. 3 j.; Olei Anethi, Olei Fœnicul. Dulc., aa ʒ iij.; Aquæ Destillatæ 3 ij. Fiat Mistura.

Form 355. MISTURA ANODYNA ACETOSA.

- R Mist. Camphoræ ʒ iv.; Tinct. Etheris Ammon. Acet. ʒ iij.; Acidi Acet. 3 ij.; Spirit. Ether. Nit. 5 ij.; Vini Ipecacuanhæ 3 ij.; Extracti Conil gr. xxx.; Syrupi Tolutani ʒ ij. M. Fiat Mist., cujus capiat Cochlearia ij. vel ij. larga, 4tâ vel quintâ quaque horâ.

Form 356. MISTURA ANODYNA CUM ZINCO.

- R Zinci Sulphatis gr. vj.; Mist. Camphoræ 3 vij.; Acidi Sulphur. Arom. 5 ss.; Tinct. Hyosciami 3 jss.; Tinct. Camphoræ Comp., 5 ij.; Syrupi Limonum 5 ij. M. Capiat Cochlearia ij. larga, ter quaterve quotidie.

Form 357. MISTURA ANTI-EMESIS.

- R Magnes. Carbonat. 3 jss.; Spirit. Ether. Sulph. Comp. 3 ij.; Tinct. Cardamom. Co. 3 ss.; Spirit. Anisi 3 v.; Olei Carui ʒ x.; Syrupi Zingiberis 3 jss.; Mist. Camphoræ 3 jss.; Aquæ Menthe Viridis 3 vss. Fiat Mist., cujus sumantur Cochlearia duo ampla, urgenti Flatu vel Nauseâ.

Form 358. MISTURA ANTIPHOLOGISTICA. (1.)

- R Potassæ Nitratis 5 ss.; Liguoris Ammonie Acetatis 3 jss.; Vini Antimonii Potassio-Tartratis 5 iij.; Mistura Amygdalarum 3 vj. Fiat Mistura, cujus sit dosis Cochlearia tria magna, quartâ quaque horâ.

Form 359. MISTURA ANTIPHOLOGISTICA. (2.)

- R Liguoris Ammonie Acetatis, Aquæ Menthe Viridis, aa 3 ij.; Aquæ Destillatæ 5 iijss.; Potassæ Nitratis ʒ ij.; Vini Antimonii Potassio-Tartratis 5 iij. Fiat Mistura, cujus sit dosis Cochlearia tria ampla, tertiâ vel quartâ quaque horâ.

Form 360. MISTURA ANTISEPTICA.

- R Acidi Hydrochlorici Dil. vel Acidi Acetici, Etheris Sulphur., aa 3 ij.; Aquæ Pimentæ ʒ ivss.; Aquæ Cinnam. 3 ij.; Syrupi Aurantii 3 j. M. Sumantur Coch. duo, omni bishoris.

Form 361. MISTURA APERIENS.

- R Magnesie Sulphatis 3 v.; Magnesie Carbonatis 3 iijss.; Aquæ Destillatæ O ij.; Spiritus Cinnamomi, Spiritus Anisi, aa 3 ij.; Tinct. Cardam. Co. 3 ss. Fiat Mistura. Dosis à 3 j. ad ʒ ij.

Form 362. MISTURA APERIENS SALINA.

- R Florum Anthemidis 3 ij.; Radicis Zingiberis concisæ 3 j.; Aquæ Ferventis O iijss. Macera per noctem; exprime, et adde Magnes. Sulphatis 3 ij.; Sodæ Sulphatis 3 jss.; Potassæ Sulphatis 5 v. M. Capiat Cyathum primo mane. (After each dose take an hour's exercise in the open air, and breakfast afterwards.)

Form 363. MISTURA AROMATICA.

- R Infusi Caryoph. 3 iv.; Aquæ Cinnam. 3 iij.; Tinct. Cinnam. 3 ij.; Magnes. Carbon. 3 jss.; Confect. Arom. ʒ j. M. Fiat Mist., cujus sumat Coch. ij. larga.

Form 364. MISTURA ARSENICALIS.

- R Liguoris Potassæ Arsenitis ʒ x.; Tinct. Cardam. Comp. 5 v.; Aquæ Cinnam. 3 ij.; Aquæ Destillatæ 3 iv. M. Fiat Mistura. Dosis Cochlearia ij. (3 j.) 3tills vel 4tis horis.

Form 365. MISTURA ARSENICALIS CUM OPIO.

- R Liguoris Potassæ Arsenitis ʒ x.; Confectionis Opii ʒ iv.; Aquæ Menthe Viridis 3 iv. M. Capiat partem 4tam post jentaculum, prandium, et cenam. (Dr. CLEGGHORN.)

Form 366. MISTURA ASSAFETIDÆ.

- R Assafetidæ 3 j.; Liguoris Ammon. Acet., Aquæ Pulegii, aa 3 iijss. M. Cap. Cochlearia unum, vel duo, pro dose.

Form 367. MISTURA ASSAFETIDÆ COMP.

- R Assafetidæ 5 j.; tere cum Aquæ Ment. Virid. 3 v.; dein adde Tinct. Castorei 5 iij.; Tinct. Valer. Comp. 3 ij.; Ether. Sulphur. 3 j. Fiat Mist., cujus capiat Cochlearia unum amplum, secundis horis.

Form 368. MIST. ASSAFETIDÆ ET VALERIANÆ COMP.

- R Tincturæ Assafetidæ, Tinct. Gentianæ Compositæ, Tinct. Valerianæ, Spiritus Ammonie Arom., aa 3 ss. M. Sumatur Cochlearia unum minimum ex Aquæ tostæ cyatho.

Form 369. MISTURA BALSAMI PERUVIANI.

- R Balsami Peruviani 3 ij. vel iij.; Mellis Despumati, 5 j. Simul diligenter tere, et gradatim adde Aquæ Destillatæ 3 vj. Dosis à fluid. 5 j. ad 3 ss. bis, ter, quaterve quotidie.

Form 370. MISTURA BALSAMI TOLUTANI.

- R Tincturæ Balsami Tolutani 3 ij.; Mucilaginis Acaciæ 3 j. Misce; adde gradatim, Aquæ Destillatæ 3 iv.; Tincturæ Camphoræ Comp., Syrupi Simplicis, aa 3 ij.; Ammonie Sesquicarbonatis, 5 ss. (vel sine.) Misce. Fiat Mistura, cujus capiat Coch. ampl. ij. ter in die.

Form 371. MISTURA BECHICA.

- R Pulveris Tragaacanthæ Compos. 5 ij.; Aquæ Destillatæ 3 xij.; Syrupi Simplicis 3 vj. Misce. Interdum adde, vel Nitratis Potassæ ʒ iv., vel Tincturæ Opii ʒ xl., vel Tincturæ Hyosciami 3 jss., vel Tincturæ Camphoræ Comp. 3 ss., vel. Oxy mellis Scillæ 5 vj., vel alium medicamentum idoneum.

Form 372. MISTURA CAMPHORÆ.

- R Camphoræ 5 j.; tere cum Spirit. Rectificati ʒ xx.; Magnesie Carbonatis ʒ ij.; et Sacchari Purificati 3 ij.; dein adde gradatim, Aquæ Destillatæ Ferventis O j. M. Fiat Mistura.

Form 373. MISTURA CAMPHORÆ COMPOSITA.

- R Camphoræ rasæ gr. xij.; Magnesie Carbon. 3 j.; Gum. Acaciæ in Pulv. 5 j.; Mist. Amygdal. Dulc. 3 vjss.; Tinct. Opii ʒ xxx. (vel Tinct. Hyosciami 5 j.); Syrupi Papaveris Alb. 5 ij. M. (In Affections of Mucous Surfaces, &c.)

Form 374. MISTURA CAMPHORATA.

- R Camphoræ gr. viij.—xvj.; Alcoholis ʒ vj.; Sacchari Albi, Pulv. Acaciæ, Magnes. Calc., aa ʒ ij.; Aquæ Puræ 3 vjss. M.

Form 375. MISTURA CAMPHORATA. (PH. DAN.)

- R Camphoræ Pulverizatæ 3 ss.; Gum. Acaciæ, Sacchari Albi, aa 3 ij.; Magnesie 5 ss.; Decocti Althææ Officinalis 3 vjss. M. (Interdum adde Tinct. Opii, vel Tinct. Hyosciami, vel Vinum Ipecacuanhæ, vel Spirit. Ether. Nit., vel Ether Sulphur., vel Extr. Conil, &c. &c.)

Form 376. MISTURA CARMINATIVA.

- R Magnesie Sulphatis 3 jss.; Magnesie Carbonatis 5 jss.; Tincturæ Cardamomi Comp. 5 jss.; Tincturæ Castorei ʒ xl.; Olei Anisi ʒ x.; Aquæ Anethi 3 xij.; Aquæ Puræ 3 vjij. Misce. Dosis à 5 ij. ad 3 jss. 4tis vel 6tis horis.

Form 377. MISTURA CARMINATIVA DEOBSTRUENS.

- R Infusi Menthe Caryophyl. (F. 239.) 3 vij.; Potassæ Bisulphatis 5 jss.; Acidi Sulphur. Dil. 5 j.; Spirit. Pimentæ, Spirit. Carui, aa 3 jss.; Spirit. Myristicæ 3 ij.; Sacchari Albi 5 ij. Fiat Mist. Capiat Cochlearia duo larga, 2tills vel 4tis horis.

Form 378. MISTURA CATHARTICA.

- R Olei Cinnamomi ʒ viij.; Sacchari Purificati 3 ss. Misce. Adde gradatim Infusi Sennæ Comp. 3 x.; Sodæ Sulphatis 3 jss.; Magnes. Sulphatis 3 j.; Tincturæ Jalapæ 3 j.; Tincturæ Sennæ Comp. 3 jss. Misce. Fiat Mistura, et per chartam cola. Dosis 3 jss. ad ʒ ij.

Form 379. MISTURA CATHARTICA AMMONIATA.

- R Olei Menthe Viridis ʒ x.; Olei Menthe Piperitis ʒ v.; Sacchari Purificati 3 iij. Misce; tum adde Infusi Sennæ Comp. 3 vj.; Sodæ Sulphatis 3 j.; Tincturæ Sennæ 5 v.; Spiritus Ammonie Aromat. 5 ij. Misce. Fiat Mistura, cujus somat partem 4tam, 2tills horis, donec alvus responderit.

## Form. 380. MISTURÆ CINCHONÆ.

R Cinchonæ Flavæ in Pulv. subactæ 5vj.; Confectionis Opil 3ij.; Pulv. Cinnam. Comp. 5j.; Ammoniac Sesquicarbon. gr. xij.; Vini Rubri Op. 3xij. M.

## Form. 381. MISTURÆ CINCHONÆ ALKALINA.

R Myrrha in pulv. 3jss.; Liquoris Potassæ Carbon. 5ij.; Decocti Cinchonæ 3vss.; Tinct. Cascariæ 5ij. Fiat Mist., de quâ sumantur Cochlearia duo ampla, bis de die.

## Form. 382. MISTURÆ CINCHONÆ APERIENS.

R Confectionis Rosæ Gallicæ 5j.; contere cum Decocti Cinchonæ Ferventis 3vij.; stent simul per partem horæ sextam, et cola.

R Liquoris Colati 3vij.; Acidi Sulphurici Diluti 5j.; Magnesiæ Sulphatis 5iv.; Spiritus Myrticæ 3ss. M. Fiat Mistura, cujus sumat Coch. ampl. ij. ter in die.

## Form. 383. MISTURÆ CONII COMPOSITA.

R Extracti Conii 5ss.; Sodæ Carbonatæ 5ss.—j.; Decocti Glycyrrh. 3vss.; Spirit. Pimentæ 5ij. M. Dosis 3ss. ad 3ij. ter quaterve quotidie.

## Form. 384. MISTURÆ CRETÆ COMP.

R Cretæ Præparat., Gum. Acaciæ, Sacchar. Purif. aa 3ss.; Olei Foeniculi ℥vij.; Aquæ Pimentæ et Aquæ Cinnam. aa 3vij.; Tinct. Aurantii 3j. M.

## Form. 385. MISTURÆ DECOCTI CINCHONÆ AMMONIATA.

R Decocti Cinchonæ 3iv.; Liq. Ammoniac Acet. 3jss.; Spirit. Ammoniac Aromat. (vel Fœtid.), vel Tinct. Ammoniac Compos.) 3ij.; Spirit. Rorismarini 5ij. M. Fiat Mistura.

## Form. 386. MISTURÆ DECOCTI CINCHONÆ COMPOSITA. (1.)

R Decocti Cinchonæ 3iv. Liq. Ammon. Acetatis 3ij.; Spirit. Æther. Nit. 5ij. M. Fiat Mistura.

## Form. 387. MISTURÆ DECOCTI CINCHONÆ COMPOSITA. (2.)

R Pulv. Cort. Cinchonæ 3vj.; decoque cum Ag. Fontane 3xvi. ad uncias octo; et sub finem coctionis adde Pulv. Radicis Serpentinæ 3ij.; Pulv. Radicis Rhei Opt. 5jss. Cola cum express.; deinde admisce Liquoris Ammon. Acet. 5ij.; Syrupi Cort. Aurantii 3j. Misce. Capiat ager, alterâ quaque horâ, Cochlearium unum.

## Form. 388. MISTURÆ DECOCTI CINCHONÆ CUM ACETO PYROLIGNEO.

R Decocti Cinchonæ 3vjss.; Acidi Acetici Fortior. (vel e Ligno destil.) 5ij.; Spirit. Rorismarini, Spirit. Pimentæ, aa 5ij. M. Fiat Mistura.

## Form. 389. MISTURÆ DEMULCENS.

R Pulveris Tragacanthæ gr. xv.; Sacchari Albi gr. xij. Tere, et paulatim adde Mist. Amygdal. Dulc. 3ij.; Mist. Camphoræ 3ijss.; Syrupi Althææ 3ss. M. Fiat Mist.

## Form. 390. MISTURÆ DEOBSTRUENS. (1.)

R Extr. Taraxaci, Extr. Humuli, aa 5ij.; Potassæ Tartarizatæ 5j.; Aquæ Foeniculi 3vj.; Vini Antimonii Potassio-Tartratis 5ij.; Oxy mel. Scillæ 3ss. M. Fiat Mist., cujus capiat Coch. j. vel ij. 3tis vel 4tis horis.

## Form. 391. MISTURÆ DEOBSTRUENS. (2.)

R Radicis Rhei 3ss.; Fol. Sennæ 3ij.; Aquæ Ferv. 3xij. Infunde per horas ij., et cola.

R Hujus Infusæ 3x.; Extracti Taraxaci, Ext. Chelid. aa 5ij.; Ext. Flor. Calendul. 3ij.; Acet. Potassæ 5vj.; Tinct. Calumbæ 3ss.; Spirit. Junip. Co. 3j.; Ætheris Hydrochlorici 3jss. M. Capiat Cochlear. j. vel ij. larga, ter de die. (In Glandular Enlargements, particularly those of the Abdomen.)

## Form. 392. MISTURÆ DEOBSTRUENS. (3.)

R Extr. Taraxaci 5jss.; Ext. Sarsæ vel Scoparii 5ij.; Potassæ Tart. 5jss.; Bi-boratis Sodæ 5ss.; Aquæ Foeniculi Dul. 3vj.; Vini Antimon. Pot.-Tart. 5ij.; Oxy mel. Scillæ 3j. M. Capiat Coch. ij.—ij. 3tis vel 4tis horis.

## Form. 393. MISTURÆ DIAPHORETICA.

R Liquoris Ammoniac Acetatis 3iv.; Vini Antimonii Pot.-Tart. 3ss.; Vini Ipecacuanhæ 3ij.; Syrupi Papaveris 3ss.; Aquæ Destillatæ 3xv. Misce. (Dosis 4 3j. ad 3j. 3tis, 4tis, vel 6tis horis. Interdum adde, vel Spiritum Ætheris Nitrici, vel Tincturam Opil.)

## Form. 394. MISTURÆ DIAPHORETICA AMMONIATA.

R Liquoris Ammoniac Acetatis 3iv.; Vini Antimonii Pot.-Tart. Vini Ipecacuanhæ, aa 3ij.; Spiritus Ætheris Nitrici 3ss.; Syrupi Papaveris 3j.; Extracti Conii gr. xv.; Aquæ Destillatæ 3xij. Misce.

## Form. 395. MISTURÆ DIGITALIS ET COLICICI COMP.

R Infusi Digitalis, Liq. Ammoniac Acetatis, aa 3ijss.; Potassæ Acetatis 3ij.; Aceti Colicici 5ij.; Opil Tincturæ ℥xx. Fiat Mist., cujus sumantur Coch. ½ larga, bis terve in die.

## Form. 396. MISTURÆ DIOSMÆ CREMATÆ.

R Infusi Diosmæ Crematæ 5vjss. (F. 231.) ; Pulv. Tragacanth. 2ij.; Tinct. Diosmæ Crematæ 3ss. M. (In Rheumatism, and Affections of the Mucous Surface, particularly those of the Urinary Organs.)

## Form. 397. MISTURÆ DIURETICA. (1.)

R Antimon. Pot.-Tart. gr. j.; Potassæ Bitart. 3ijss.; Bi-boratis Sodæ 5ss.; Infusi Juniperi 3xijss.; Spirit. Æther. Nit. 5ij.; Tinct. Opil Comp. ℥xxv. ad L. M. Capiat Coch. j. larg. 2da quaque horâ. (Altered from AUGUSTIN.)

## Form. 398. MISTURÆ DIURETICA. (2.)

R Potassæ Bitart. 5ij.; Bi-boratis Sodæ 3j.; Aquæ Foeniculi 3vij.; Spirit. Junip. Comp. et Spirit. Æther. Nit. aa 5ij.; Syrup. Papaveris 3ss.

## Form. 399. MISTURÆ DIURETICA. (3.)

R Baccarum Juniperi contus. 5vj.; Carul Semina. contus. 5ijss.; Anisi Semin. cont. 3jss.; Aquæ Ferventis Oj. Macera per horas tres, et cola.

R Liquoris Colati 3xij.; Spiritus Juniperi Compositi 3ij.; Potassæ Nitratis 2ij.; Syrupi Scillæ 3ss. Fiat Mistura, de quâ sumatur Cyathus subindis.

## Form. 400. MISTURÆ DIURETICA. (4.)

R Infusi Digitalis, Aquæ Anethi, aa 3ijss.; Potassæ Acetatis 5ijss.; Scillæ Aceti (vel Acet. Colicici) 5ij.; Tinct. Opil ℥x. Fiat Mist., cujus capiat Cochlear. ½ larga, bis terve quotidie.

## Form. 401. MISTURÆ DIURETICA. (5.)

R Gum. Acaciæ 5v.; Saponis Med. 3ss.; Carbonatis Potassæ 5ij.; Potassæ Nitratis 2ij.; Infusi Juniperi ℥ij. (In Gout, with double its quantity of Potash, and a stomachic Tincture, and the Wine or Tincture of Colchicum.)

## Form. 402. MISTURÆ EMETICA EXCITANS. (1.)

R Zinci Sulphatis 2ij.; Aquæ Menth. Pip. 3vjss. Solve, et adde Vini Ipecacuanhæ, Tinct. Serpentinæ, aa 3ss.; Tinct. Capsici 2ij.; Olei Anthemidis ℥ss. Misce; et fiat Mist., cujus capiat partem tertiam vel quartam, intervallis brevibus.

## Form. 403. MISTURÆ EMETICA EXCITANS. (2.)

R Antimon. Pot.-Tart. gr. xij.; solve in Aquæ Menthæ Piper. 3vjss.; et adde Vini Ipecacuanhæ, Tinct. Serpentinæ, aa 3ss.; Tinct. Capsici 2ij.; Olei Anthemidis ℥xij. M. Capiat partem quartam vel tertiam, intervallis brevibus, ad effectum plenum.

## Form. 404. MISTURÆ EXPECTORANS.

R Misturæ Amygdalæ Dulc. 5v.; Vini Ipecacuanhæ, Tincturæ Scillæ, aa 5j.; Syrupi Tolutani 5ij. Misce. Sumat Cochlearium magnum, urgente Tussu. (In Humoral Asthma, and the latter Stage of Catarrh.)

## Form. 405. MISTURÆ FEBRIFUGA. (1.)

R Camphoræ 2j.; Pulv. Gum. Acaciæ 5j.; Mist. Amygdal. Dulc. 3ij.; Potassæ Nitratis 5j. ad 5ij.; Aq. Flor. Sambuci Nig. 3iv.; Syrupi Papav. Abs. (vel Syr. Limonia) 3ss. M. Capiat 3ss.—5j. 3tis vel 4tis horis.

## Form. 406. MISTURÆ FEBRIFUGA. (2.)

R Misturæ Camphoræ 3xij.; Antimonii Pot.-Tart. gr. ij.; Potassæ Nitratis 3vj.; Spiritus Ætheris Nitrici 3ss.; Syrupi Limonium 3ss. Misce. Interdum adde, vel Vinum Ipecacuanhæ, vel Tincturam Digitalis, vel Tincturam Opil, vel Syrupum Papaveris.

## Form. 407. MISTURÆ FEBRIFUGA. (3.)

R Ammoniac Hydrochlor., Sacri Glycyrrh. Infusæ, aa 5j.; Aquæ Font. 3v. Solve, et adde Vini Antimonii Pot.-Tart. 5ij.; Oxy mel. Scillæ 3ss. M. (HECKER.)

## Form. 408. MISTURA FERRIFUGA. (PEYSSON.)

R Antimonii Potassio-Tartratis gr. j.; Gum. Tragacanthæ ʒ j.; Aquæ Communis ʒ viij.; Tinct. Opii ℥ xx.; Syrupi Papaveris ʒ vij. M.

## Form. 409. MISTURA FERRIFUGA NERVINA.

R Camphoræ rasæ ʒ j.—ʒ ij.; Vitel. Ovor. q. s. Subige, et adde Decocti Cinchonæ ʒ viiss.; Tinct. Opii Comp. (vide Form.) ʒ ss.; Ether. Sulphur. ʒ ij. M. Capiat ʒ ss.—ʒ jss. 5tis vel 6tis horis.

## Form. 410. MISTURA GUALIACI AMMONIATA.

R Gualiaci Gummi Resinæ, Pulveris Acaciæ, aa ʒ ij.; Decocti Glycyrrhizæ O ss.; Liquoris Ammoniacæ Sesquicarbonatis ʒ jss. Tere Gualiacum et Pulv. Acaciæ cum Liquore Ammoniacæ, et gradatim adde Decoctum.

## Form. 411. MISTURA GUALIACI COMP.

R Gum. Gualiaci, Gum. Ammoniaci, Gum. Acaciæ, aa ʒ ij.; solve terendo in Aquæ Fœniculi ʒ viiss., et adde Vinî Antimonii Potassio-Tartratis ʒ ss.; Syrupi Althææ ʒ vj. M. Capiat cochleare unum amplum tertis vel quartis horis.

## Form. 412. MISTURA CUM HYDRARGYRI BICHLORIDO.

R Decocti Glycyrrhizæ ʒ v.; Aquæ Cinnamonii ʒ ij.; Liquoris Hydrargyri Bichloridi (Form. 322.), Syrupi Aurantii, aa ʒ ss. Misce. Fiat Mistura, cujus sumat Coch. ampl. ij. vel. ij. statim post cibum, bis terve in die. (SPRAGUE.)

## Form. 413. MISTURA INFUSI CUSPARLE COMPOSITA.

R Cuspariæ Corticis contusæ ʒ j.; Aurantii Corticis exsiccati ʒ ss.; Aquæ Ferrentis Octarium j. Macera per horas quatuor in vase clauso, et cola.

R Infusi Colati ʒ vij.; Tincturæ Cinnamonii, Syrupi Aurantiorum, aa ʒ ss.; Crete Preparatæ ʒ j. M. Fiat Mistura, de qua sumatur Cyathus (Cochlearia ij.—iv.) ter vel quater quotidie.

## Form. 414. MISTURA INFUSI SALICIS COMP.

R Cort. Salicis contusæ ʒ ij.; Aquæ O ij. Decoqe ad octarium j.; dein adde Caryophyl. contus. ʒ ss., et cola.

R Liquoris Colati ʒ vij.; Tincturæ Aurantii ʒ vij.; Syrupi Aurantii ʒ ij. M. Sumat quartam partem ter die.

## Form. 415. MISTURA INFUSI SENEGÆ COMP.

R Rad. Polyg. Senegæ conc.; Rad. Glycyrrhizæ, aa ʒ ss. Decoqe cum Aquæ Fontanæ xvj. ad uncias octo. In colat. dissolve Ammon. Hydrochlor. ʒ ij.; Pulvæ Tamarind. ʒ j.; Antimonii Potassio-Tart. gr. j.; Syrup. Althææ ʒ j. M. Capiat ager, alterâ quaque horâ, Cochleare unum.

## Form. 416. MISTURA INFUSI SERPENTARIE COMP. (1.)

R Olei Cinnamonii ℥ vj.; Sacchari Purif. ʒ ij.; terantur benè, et adde Infusi Serpentariæ (F. 262.) ʒ vij.; Spirit. Ætheris Hydrochlorici ʒ ss.; Tinct. Capsici ʒ ss. M. Fiat Mist., cujus capiat Coch. ij.—iv. tertis vel quartis horis.

## Form. 417. MISTURA INFUSI SERPENTARIE COMP. (2.)

R Infusi Serpentariæ ʒ vj.; Tinct. Camph. Comp. ʒ v.; Spirit. Ammoniac Arom. ʒ ij.; Syrupi Aurantii ʒ j. M. Capiat partem quartam tertis vel quartis horis.

## Form. 418. MISTURA INFUSI UVÆ URSI.

R Infus UVæ Ursi ʒ xlv.; Potassæ Bicarbon. gr. xx.; Extracti Conii, gr. ij. ad gr. vj.; Extracti Papaveris gr. v. ad viij.; Syrupi Zingiberis, ʒ ij. M. Fiat Haustus, ter in die sumendus.

## Form. 419. MISTURA INFUSI UVÆ URSI COMPOSITA.

R UVæ Ursi Fol. ʒ jss.; Radicis Rhei concis. et cont. ʒ j.; Aquæ Ferrentis ʒ xlv. Macera per horas ij. in vase clauso, deinde cola.

R Liquoris Colati ʒ viiss.; Sodæ Carbon. ʒ jss.; Tinct. Opii ℥ xlv. (vel Hyoscyami ʒ jss.); Tinct. Camphoræ Comp. ʒ ij.; Syrupi Foliatani ʒ jss. M. Fiat Mist., cujus capiat Cochlearia duo magna, quatuor vices in die.

## Form. 420. MISTURA LAXANS.

R Infusi Rosæ Com. ʒ viiss.; Acidi Sulphur. Dil. ℥ xx.; Potassæ Sulphatis ʒ ij.; Tinct. Aurantii Comp. ʒ ij. M. Fiat Mist., cujus capiat Cochlearia ij. larga, tertis vel quartis horis.

## Form. 421. MISTURA MUCILAGINIS ANODYNA.

R Mucilaginis Tragacanthæ ʒ jss.; Oxymellis Scillæ ʒ ss.; Syrupi Papaveris ʒ j. Misce. Fiat Mistura. Cochleare amplum, urgenti Tusse, gradatim deglutendum.

(If the muellage of Tragacanth should not be at hand, its place may be supplied by Pulvis Tragacanthæ Comp. ʒ jss.; Aquæ Destil. ʒ jss. SPRAGUE.)

## Form. 422. MISTURA MYRRHÆ.

R Myrrhæ ʒ jss.; Decocti Glycyrrhizæ Ferrentis ʒ vss. Simul tere, et cola. Dosis ʒ j. bis vel ter quotidie, Singulis dosibus interdum adde, Sodæ Carbonatis gr. xlv., vel Acidi Sulphurici Aromatici minim. xv., vel Tincturæ Camphoræ Comp. ʒ ss. Misce. (In the latter stages of Phthisis Pulmonalis, when languor or debility is a very prominent symptom, the above mixture, combined according to circumstances, is an excellent medicine.)

## Form. 423. MISTURA NERVINA. (1.)

R Misturæ Camphoræ ʒ ij.; Misturæ Assafoetidæ ʒ ij.; Tinct. Valerianæ, Tinct. Ammoniacæ Compos., Spiritus Ætheris Sulph. Compos., aa ʒ ij. M. Fiat Mistura, cujus sumantur Cochlearia duo ampla subindè.

## Form. 424. MISTURA NERVINA. (2.)

R Misturæ Camphoræ ʒ vij.; Spiritus Ætheris Sulphurici Comp., Tinct. Ammoniacæ Compos., aa ʒ jss.; Syrupi Croci ʒ ss. Fiat Mistura, de qua sumantur Cochlearia duo vel tria magna, urgente Agitatione.

## Form. 425. MISTURA OLEOSA.

R Olei Olivæ (vel Olei Lini), Aquæ Pimentæ, aa O jss.; Potassæ Carbonatis ʒ vj. Misce. Dosis ʒ j. ad ʒ jss. Antiphlogista fit addendo Liquoris Antimonii Pot.-Tart. ʒ ss. ad ʒ ij. Anodyna fit addendo Tincturæ Opii ʒ j. ad ʒ ij. Foliatius fit usu Spiritus Ammoniacæ Aromatici loco Potassæ Carbonatis.

## Form. 426. MISTURA PECTORALIS. (1.)

R Rad. Althææ ʒ jss.; Semin. Anisi cont. ʒ ij.; Aq. Ferrent. q. s. ut sit Colaturæ ʒ xlv. Adde Ammoniacæ Hydrochlor. ʒ ij.; Succ. Insp. Glycyrrh. ʒ ss. M. (AUST. PHAR.)

## Form. 427. MISTURA PECTORALIS. (2.)

R Decocti Cetrariæ ʒ xj.; Vinî Ipecacuanhæ ʒ ij.; Extr. Conii ʒ j.; Olei Anisi ℥ xlv.; Syrupi Althææ et Syrupi Papaveris aa ʒ ij. M. Capiat Coch. ij. vel iv. quater in die.

## Form. 428. MISTURA PHOSPHORATA.

R Phosphori gr. ij.; Olei Terrebint. ʒ ss.; Olei Olivæ ʒ jss.; Mucilag. Acaciæ ʒ j.; Aquæ Anethi ʒ iv.; Syrupi Zingiberis ʒ j.; Olei Caryophyl. ℥ vj.

## Form. 429. MISTURA PURGANS. (1.)

R Infusi Sennæ Comp. ʒ iiss.; Magnesiæ Sulphatis ʒ j.; Aquæ Menthæ Sativ. ʒ jss.; Tinct. Sennæ Comp. ʒ ss. M. Sumantur Cochlearia iv. primo mane, et repetantur post horas tres, si opus sit.

## Form. 430. MISTURA PURGANS. (2.)

R Fol. Sennæ, Conservæ Menthæ Viridis (F. 49.), aa ʒ ss.; Sem. Corland. contus. ʒ ij.; Aquæ Ferrentis ʒ viij. Macera per horas duas, et cola.

R Infusi supraprescripti ʒ vij.; Sodæ Sulphatis ʒ j.; Tincturæ Sennæ Comp. ʒ vj.; Tinct. Cardam. Co. ʒ ij.; Sp. Ammoniac Arom. ʒ ij. M. Ft. Mistura, Capiat partem 4tam secundis horis, donec benè solutus sit alvus, et pro re natâ repetatur.

## Form. 431. MISTURA REFRIGERANS.

R Camphoræ rasæ gr. x.—ʒ j.; tere cum Muellag. Acaciæ ʒ ij.; Ammon. Hydrochlor. ʒ j.—ʒ jss.; Aq. Flor. Aurantii., Aq. Coia., aa ʒ ij.; Syrupi Aurantii ʒ ss. M.

## Form. 432. MISTURA RESOLVENS.

R Flor. Arnicæ ʒ jss.; Aq. Fervid. q. s. ut sint Colaturæ ʒ viiss. Adde Potassæ Carbon. ʒ j.; Tinct. Lavandul. Co. ʒ jss. M. (In Engorgements of Glands, &c.)

## Form. 433. MISTURA RHEI COMPOSITA.

R Rhei Radicis contrizæ ʒ ss.; Sodæ Carbonatis ʒ j.; Decocti Glycyrrhizæ ʒ v. et ʒ ij.; Tincturæ Aurantii, ʒ vj. Misce. Dosis ʒ ʒ ss. ad ʒ j. semel, bis, vel ter quotidie. (This is a pleasant and efficacious method of administering small doses of Rhubarb in Dyspepsia. — SPRAGUE.)

## Form. 434. MISTURA RHODII COMP. (1.)

R Tincturæ Rhodii 3 ij.; Mucil. Acaciæ 5 vj. Terantur probe simul; adde gradatim, Infusi Caryophyllorum 3 iv.; Syrupi Zingiberis 3 ss. M. Fiat Mistura. Sumat partem 4tam ter in die, urgente flatu.

## Form. 435. MISTURA RHODII COMP. (2.)

R Tincturæ Rhodii 3 ss.; Mucil. Acaciæ 5 vj. Tere benè, et adde gradatim, Infusi Uvae Ursi 3 vj.; Syrupi Papaveris 5 vj. M. Fiat Mistura. Dosis partem 4tam, ter quaterve in die. (In Asthna, and in Chronic Catarrhs, &c.)

## Form. 436. MISTURA SALINA.

R Mist. Camphoræ 3 ivss.; Liq. Ammon. Acet. 3 ij.; Spirit. Ether. Nit. 5 ij.; Potassæ Nit. 3 ij.; Syrupi Limonis 3 ij. M. Fiat Mist., cujus capiat Cochlearia ij. larga, quartâ quaque horâ.

## Form. 437. MISTURA SALINA ANTISEPTICA. (1.)

R Infusi (vel Decocti) Cinchonæ 3 vij.; Sodii Chloridi 3 j.—5 ij.; Potassæ Chloratis 5 ss.—3 j. Solve, et adde Tinct. Serpentariæ 3 ss. M.

## Form. 438. MISTURA SALINA ANTISEPTICA. (2.)

R Infusi (vel Decocti) Cinchonæ, Mist. Camphoræ, aa 3 ijss.; Potassæ Nitratæ, Potassæ Chloratis, aa 3 ij.; Tinct. Serpentariæ 3 ss. M.

## Form. 439. MISTURA SALINA ANTISEPTICA. (3.)

R Mist. Camphoræ 3 vij.; Potassæ Chloratis 3 ij.; Sodii Chloridi 3 j.; Tinct. Serpentariæ 3 ss.; Spirit. Lavand. 3 ij. M.

## Form. 440. MISTURA SALINA FEBRIFUGA. (1.)

R Mist. Camphoræ 3 ivss.; Liq. Ammon. Acet. 3 ijss.; Magnesie Sulphatis 3 ss.—5 j. (vel Potassæ Sulph. 5 ijss.); Spirit. Ether. Nit. 5 ij. M.

## Form. 441. MISTURA SALINA FEBRIFUGA. (2.)

R Mist. Camphoræ 3 ivss.; Liq. Ammon. Acet. 3 ij.; Sodæ Sulphatis (vel Sodæ Phosphatis) 3 vj.; Spirit. Ether. Nitrici 3 ij. M.

## Form. 442. MISTURA SEDATIVA.

R Magnesie Carbonatis, Cretæ Præparatæ, Pulv. Acaciæ, aa 3 ij.; Spiritus Ammoniac Aromat. 5 ijss.; Tinct. Assafoetidæ 5 ij.; Syrupi Papaveris 3 ss.; Aquæ Destillatæ O j. Miscæ. Dosis à 3 ss. ad 3 jss. 3tis, vel 4tis, vel 6tis horis. Interdum ad Tinct. Catechu, &c. &c.

## Form. 443. MISTURA STRYCHNINE.

R Strychninæ Parisiense gr. j.; Sacchari Purif. 3 jss.; Aquæ Destill. 3 ij.; Acidi Acetici qtt. ij. M. Capiat Cochlearia minima ij. mane nocteque.

## Form. 444. MIST. TEREBINTHINÆ VENETÆ (CLOSSIUS.)

R Terebinthinæ Venet. 5 j.—3 jss.; Vitelli Ovorum q. s.; et adde Aquæ Menthæ Piperitæ 3 ivss., Capiat Cochlearia j. vel ij. pro re natâ. (Against Worms and Chronic Affections of the Mucous Surfaces.)

## Form. 445. MISTURA TONICA. (1.)

R Infusi Cascariillæ (vel Gentianæ Comp.) 3 vij.; Potassæ Carb. 5 j.—5 jss.; Tinct. Aurantii Comp., Spirit. Pimentæ, aa 3 ij. M.

## Form. 446. MISTURA TONICA. (2.)

R Infusi Cascariillæ O jss.; Acidi Sulphurici Aromat. 3 ij. Miscæ. Dosis à Cochlear. ij. parv. ad Cochlear. ij. magna, bis die.

## Form. 447. MISTURA VERMIFUGA.

R Rad. Valer. Min., Semin. Santon., aa 3 ss. Infunde Aq. Font. Fervid. 3 vij.; digere per horam, dein cola. Liq. colato adde Assafoetidæ 5 j. in Vitell. Ovi solute. Fiat Mistura.

## Form. 448. MISTURA VINOSA.

R Vini 3 vj.; Ovorum duorum Vitellos; Sacchari Purificat. 3 ss.; Olei Cinnamom. ʒ iv.; Tinct. Capsici ʒ j. M. Dosis 3 jss. ter quaterve, aut sæpius, quotidie, argentibus Languoribus.

## Form. 449. OLEUM CAMPHORÆ.

R Acidi Nitrici quantum vells; Camphoræ q. s. ad Acidum saturandum. Serva in vase bene obturato. (Ves.)

## Form. 450. PILULÆ ALOES CUM FERRO.

R Aloes Spicat Extracti 5 jss.; Myrrhæ Gummi Res pulv. 5 ij.; Extracti Gentianæ ʒ iv.; Ferri Sulph. ʒ ij.; Theriacæ Purificat. q. s. Simul contunde in Pilulas cxx. divide. Dosis à ij. ad iv. semel vel quotidie.

## Form. 451. PILULÆ ALOES CUM FERRO COMPOSITÆ

R Masse Pilul. Aloes cum Myrrhâ, Pilul. Ferri Comp. Pilul. Galban. Comp., aa ʒ ij.; Sodæ Carbon. et ʒ j.; Olei Junip. Sabin. ʒ iv. Contunde simul fiat massa aequalis, in Pilulas xxx. distribuas Capiat agra binas, mane nocteque.

## Form. 452. PILULÆ ALOES ET FERRI.

R Ferri Sulphatis, Potassæ Carbonatæ, aa ʒ j.; Myrr pulver. 5 j.; Aloes pulver. 5 ss. M., et divide Pilulas xxx. Capiat ij. vel ij. nocte maneque.

## Form. 453. PILULÆ ALOES ET MOSCHI COMPOSITÆ

R Pilul. Aloes cum Myrrhâ 5 j.; Camph. rasæ gr. x Moschi gr. xxvij.; Balsami Peruvianii q. s. M. Fiat Pilulæ xxiv., quarum capiat binas omni nocte.

## Form. 454. PILULÆ ALOES ET SCAMMONIÆ COMP.

R Aloes Spicat. ʒ j.; Scammon. gr. xij.; Extr. B. ʒ ijss.; Baccar. Capsici pulv. gr. viij.; Olei Caryop. ʒ vj. M. Fiat Pilulæ xvij., quarum sumas binas horâ decubitûs.

## Form. 455. PILULÆ ALTERNATIVÆ. (1.)

R Massæ Pilul. Hydrarg. Chloridi Comp. ʒ ij.; Sapo Castil. 5 ss.; Extr. Sarsæ et Extr. Taraxaci aa ʒ j. Miscæ benè, et divide in Pilulas lx., quarum cap binas vel tres, ter quotidie.

## Form. 456. PILULÆ ALTERNATIVÆ. (2.)

R Scillæ Radicis exsic. gr. vj.; Pulv. Fol. Digitalis xij.; Hydrarg. Chloridi gr. vj.; Myrrhæ Pulv. ʒ i Tere simul, et adde Assafoetid. 5 ss.; Extr. Gentia q. s. Fiat massa aequalis, et divide in Pil. xlii. quarum capiat unam mane, meridie, et nocte.

## Form. 457. PILULÆ AMMONIACI COMPOSITÆ.

R Gummi Ammoniaci 5 j.; Saponis Castil. Felle B. Inplast., Pilulæ Hydrarg., Pulv. Follior. Conil. I tracti Conil. aa 5 ss.; Ext. Taraxaci 3 ij.; Antime Oxysulphuret ʒ j.; Theriacæ Purif. q. s. Contus in massam æqualem, et divide in Pilulas lxxi. quarum capiat binas vel tres, ter quotidie. (De struent, dissolvent, &c.)

## Form. 458. PILULÆ AMMONIÆ ET ANTHEMIDIS.

R Ammonie Sesquicarbonatis Pulver., Extracti Anthemidis, aa 5 ss. Fiat massa, in Pilulas xij. divide quarum sumatur una bis vel ter die.

## Form. 459. PILULÆ AMMONIO-SULPHATIS CUPRI CO

R Cupri Ammonio-Sulphatis, Oxidi Zincæ, aa gr. x xij.; Sacchari Albi, Pulv. Tragacanthæ, aa gr. ʒ Mucilag. Acaciæ q. s. ut fiat Pilulæ xij., quæ capiat unam bis terve quotidie. (Epilepsy, Chæ &c.)

## Form. 460. PILULÆ ANODYNÆ.

R Camphoræ rasæ gr. ij.—vj.; Potassæ Nitratæ gr. —vij.; Extr. Hyoscyami gr. ij.—gr. viij.; Syrupi paveris q. s. Miscæ. Fiat Pilulæ ij.—vj. sumenda.

## Form. 461. MASSA PILULARUM ANODYNARUM.

R Opi Crudi in Pulv. subtiliss. 5 ss.; Extracti Hyoscyami 5 jss.; Saponis Duri, Iridis Flor. pulv. aa ʒ Contunde, ut fiat massa, in Pilulas sexaginta equè distribuenda.

(Ten grains of the mass contain one grain of opium and five of the extract of henbane.)

## Form. 462. PILULÆ ANODYNO-APERIENTES. (1.)

R Pulv. Ipecacuanhæ gr. x.; Extracti Colocynth. Comp. 5 j.; Extracti Hyoscyami 3 ss.; Pilulæ Hydrarg. ʒ j.; Saponis Castil. gr. x.; Olei Caryop. ʒ ij. Contunde in massam æqualem, et divide Pilulas xxx., quarum capiat unam, duas, vel tres dose.

## Form. 463. PILULÆ ANODYNO-APERIENTES. (2.)

R Pulv. Ipecacuanhæ gr. viij.; Extr. Colocynth. Co ʒ ijss.; Extr. Hyoscyami 5 ss.; Felle Taur. Insc. ʒ j. Contunde simul, et divide massam in Pil. xxiv., quarum capiat unam, duas, vel tres pro dos

- Form. 464. PILULÆ ANTIMONII ALTERNATIVÆ.  
 R Antimonii Oxysulphureti ʒj.; Florum Sulphuris ʒij.;  
 Camphoræ rasæ ʒj.; Extracti Taraxaci (vel Extr.  
 Sarsæ) ʒijss. Fiat massa aequalis, et divide in Pilulas  
 xcv. Capiat duas vel tres, ter quotidie.
- Form. 465. PILULÆ ANTIMONII ET GUAIAICI COMPOSITÆ.  
 R Antimonii Oxysulphureti ʒj.; Florum Sulphur.  
 ʒij.; Resinæ Guaiaci, Extr. Conii, ʒā ʒij.; Syrupi  
 Althææ q. s. Fiat massa aequalis, et divide in Pilulas  
 cxx. Capiat binas vel tres ter die.
- Form. 466. PIL. ANTIMONII OXY-SULPHURETI COMP. (1.)  
 R Antimonii Oxysulphureti gr. v.; Pilul. Hydrarg.,  
 Extracti Hyoscyami, ʒā ʒj. Miscio ut fiat massa  
 aequalis in Pilulas decem dividenda, quarum sumatur  
 una ter die.
- Form. 467. PIL. ANTIMONII OXY-SULPHURETI COMP. (2.)  
 R Antimonii Oxysulphureti, Hydrargyri Chloridi, ʒā gr.  
 ss.; Extracti Conii gr. iv. Fiat Pilula ter die su-  
 menda.
- Form. 468. PILULÆ ANTISPASMODICÆ.  
 R Gum. Ammoniaci ʒj.; Benzoini, Pulv. Myrrhæ, ʒā  
 ʒij.; Assafoetidæ ʒss.; Camphoræ ʒj.; Tinct. Opil  
 ℥ xij. Miscio. Divide in Pilulas lx., quarum capiat  
 æger, omni triduo, duas vel tres.
- Form. 469. PILULÆ ANTISPASMODICÆ PIERQUINI.  
 R Camphoræ, Potassæ Nitratis, Pulv. Digitalis Pur-  
 pur., ʒā ʒss.; Pulv. Cinchonæ Flav. ʒj.; Extracti  
 Gentianæ ʒij.; Syrup. Simp. q. s. M. Fiat Pilu-  
 læ lxx.
- Form. 470. PILULÆ APERIENTES COMP.  
 R Pilul. Hydrarg., Pilul. Aloes cum Myrrhâ, ʒā ʒj.;  
 Pilul. Cambog. Comp. gr. xvj.; Pulv. Mastiches gr.  
 vj.; Olei Caryophyl. ℥ ij. M. Fiat massa aequalis,  
 et divide in Pilulas xxiv., quarum capiat binas horâ  
 somni quotidie.
- Form. 471. PILULÆ APERIENTES ALTERNATIVÆ.  
 R Pilul. Hydrarg. ʒj.; Antimonii Pot.-Tart. gr. jss.;  
 Extr. Jalapæ ʒjss.; Felliis Tauri inspissati ʒss.;  
 Saponis Castil. gr. xv. Contunde in massam æqualem,  
 et divide in Pilulas xl.; quarum capiat binas vel tres  
 omni nocte.
- Form. 472. PIL. ARGENTI NITRATIS ET BELLADONNÆ.  
 R Argenti Nitratis pulv. gr. ij.—iv.; Pulv. Radicis Bello-  
 donnæ ʒj.; Extr. Glycyrrh. ʒj. Miscio bene, et di-  
 vide in Pilulas xxxvj.; quarum capiat unam ad tres,  
 bis terve quotidie. (In Pertussis and Epilepsy. M.  
 BORIES.)
- Form. 473. PILULÆ ARGENTI NITRATIS COMPOSITÆ.  
 R Nitratis Argenti pulv. gr. v.; Opil Puri gr. x.; Cam-  
 phoræ rasæ, Nucis Myristicæ, ʒā ʒjss.; Pulv. Acaciæ  
 ʒss.; Syrupi Simp. q. s. M. Divide in Pilulas  
 xxxvj., quarum capiat unam ad tres, bis terve quoti-  
 die.
- Form. 474. PILULÆ ARGENTI NITRATIS ET GENTIANÆ.  
 R Argenti Nitratis gr. ix.; Opil Puri gr. v.; Extr. Gen-  
 tianæ, Extr. Glycyrrh., ʒā ʒjss. Divide in Pilulas  
 lv., quarum capiat unam ad tres vel quatuor, bis terve  
 quotidie. (NIEMANN.)
- Form. 475. PILULÆ ARGENTI NITRATIS OPIATÆ.  
 R Argenti Nitratis pulv. gr. x.; Moschi ʒj.; Opil ʒjss.;  
 Camphoræ ʒij.; Pulv. Acaciæ ʒss.; Syrupi Simp.  
 q. s. Miscio bene, et divide in Pilulas lxxx., quarum  
 capiat unam ad quatuor bis terve quotidie. (VAN  
 MONS, CADET DE GASSICOURT, et BATHIER.)
- Form. 476. PILULÆ ARSENICALES. (1.)  
 R Acidi Arseniosi gr. ij.; Opil Puri gr. viij.; Saponis  
 Medic. gr. xxxvj. Divide in Pilulas xxiv., quarum  
 capiat j.—ij. pro dose.
- Form. 477. PILULÆ ARSENICALES. (2.)  
 R Acidi Arseniosi gr. vj.; Opil gr. xij.; Ammoniaci Hy-  
 drochlor. ʒss.; Mucilag. Acaciæ ʒij.; Syrupi Simp.  
 q. s. M. Divide in Pilulas xxx., quarum capiat  
 unam vel binas ter die.
- Form. 478. PILULÆ ARSENITIS FERRI. (BIETT.)  
 R Proto-Arsenitis Ferri gr. ij.; Extr. Humul. ʒij.;  
 Pulv. Althææ ʒss.; Syrupi Aurant. q. s. M. Divide  
 in Pilulas xlvij., quarum capiat unam in die.
- Form. 479. PILULÆ ASSAFOETIDÆ CUM CINCHONA.  
 R Assafoetidæ Gummi Resinæ ʒj.; Extracti Cinchonæ  
 Opt. ʒij.; Saponis Duri, ʒss.; Olei Pulegii ℥ xij.;  
 Theriac. Purificat. q. s. ut fiat massa; in Pilulas  
 xlvij. divide; quarum capiat ij. vel iv. nocte  
 maneque.
- Form. 480. PILULÆ ASSAFOETIDÆ COMPOSITÆ.  
 R Assafoetid., Castorei, Valerianæ, Succini, ʒā pulveriz.  
 ʒss.; Camphoræ gr. x.; Olei Cajuputi q. s. M.  
 Fiat Pilulæ xxxvj., quarum capiat binas pro dose.
- Form. 481. PILULÆ ASSAFOETIDÆ CUM FELLE.  
 R Assafoetidæ, Felliis Tauri inspissati, ʒā ʒj.; Pulv.  
 Rhei ʒj.; Syrupi q. s. M. Fiat Pilul. xl.
- Form. 482. PILULÆ ASSAFOETIDÆ ET VALERIANÆ COMP.  
 R Gum. Assafoetidæ, Pulv. Valerianæ, ʒā ʒj.; Extr.  
 Aconiti gr. vj.; Pulv. Scillas gr. viij.; Castorei ʒss.;  
 Ammoniaci Sesquicarbon. gr. xvj.; Syrupi Papaveris  
 q. s. M. Fiat Pilulæ xlvij., quarum capiat duas  
 ad quatuor pro dose. (In Spasmodic Affections of  
 the Respiratory Organs.—RICHTER.)
- Form. 483. PILULÆ ASTRINGENTES.  
 R Extr. Cinchonæ, Ferri Ammonio-Chloridi, Aluminae  
 Sulph., Pulv. Aromat., ʒā ʒjss.; Olei Caryoph. q. s.  
 M. Fiat Pilulæ lxxxiv., quarum capiat j.—ij. pro  
 dose.
- Form. 484. PILULÆ BALSAMICÆ.  
 R Myrrhæ Gummi Resinæ pulv. ʒij.; Galbani, Assafoe-  
 tidæ, ʒā ʒj.; Capsici Anni pulv. gr. xv.; Balsami  
 Peruviani ʒj. M. Fiat Pilulæ xxx.; ʒ quibus  
 sumantur binæ vel tres, bis terve de die.
- Form. 485. PILULÆ BALSAMICÆ. (1.)  
 R Extr. Aloes ʒij.; Extr. Rhei ʒj.; Balsami Peru-  
 viani ʒā ʒss.; Croci Stigmat. et Myrrhæ ʒā ʒj.;  
 Extr. Opil gr. v.; Spirit. Vini et Syrupi q. s. Fiat  
 Pilulæ lxxx., quarum capiat unam ad quatuor pro  
 dose.
- Form. 486. PILULÆ BALSAMICÆ. (2.)  
 R Terebinthinæ Chiensis, Spermaceti, ʒā ʒjss.; Pulv.  
 Myrrhæ ʒj.; Oilbani Pulv. q. s. ut fiat Pilulæ  
 lxx., quarum capiat unam vel duas omni tertîâ vel  
 quartâ horâ.
- Form. 487. PILULÆ BALSAMICÆ CAMPHORATÆ.  
 R Acidi Benzoiici ʒj.; Camphoræ, Croci Stig., Balsami  
 Peruviani, G. Ammoniaci, ʒā ʒj.; Mucilag. Acaciæ  
 q. s. M. Fiat massa, quam divide in Pilulas xxxvj.,  
 quarum capiat binas pro dose.
- Form. 488. PILULÆ BELLADONNÆ.  
 R Extr. Belladonnæ gr. vj.; Pulv. Rad. Glycyrrh. ʒss.;  
 Succi Inspissati Sambuci Nig. q. s. ut fiat Pilulæ  
 xij. Capiat unam ad tres pro dose.
- Form. 489. PILULÆ BENZOINI ET TEREBINTHINÆ COMP.  
 R Myrrhæ, G. Ammoniaci, ʒā ʒjss.; Benzoini ʒj.;  
 Extr. Gentianæ ʒij.; Terebinth. Venet. ʒjss.; Pulv.  
 Rhei q. s. Fiat Massa aequalis, et divide in Pilulas  
 gr. lv. pond. (In Hypochondriasis, Habitual Con-  
 stipation, &c.)
- Form. 490. PILULÆ BISMUTHI.  
 R Bismuthi Tris-nit., Castorei, ʒā gr. j.—ij.; Pulv.  
 Glycyrrh. et Mellis q. s. ut fiat Pilulæ ij., tertis  
 vel quartis horis sumendæ.
- Form. 491. PILULÆ BRUCIÆ.  
 R Bruciæ Puræ, gr. xij.; Conservæ Rosar. ʒij. Miscio  
 benè, et divide in Pilulas xxiv. æquales. Capiat unam  
 ad quatuor pro dose.
- Form. 492. PILULÆ CAMBOGLE COMPOSITÆ.  
 R Cambogis ʒj.; solve in Olei Ricini pauxillo, et adde  
 Pilul. Aloës cum Myrrhâ, Pilul. Galbani, Comp.,  
 Pilul. Hydrarg., ʒā ʒij. Contunde benè simul, et  
 divide in Pilulas xlvij. Capiat unam ad tres pro dose.
- Form. 493. PILULÆ CAMPHORÆ ET ANTIMONII THERIACÆ.  
 R Camphoræ rasæ gr. iv.; Pulv. Jacobi Veri gr. ij.;  
 Opil Puri gr. ss.; Syrupi Simp. q. s. Fiat Pilulæ ij.,  
 quartâ vel sextâ quaque horâ sumendæ.
- Form. 494. PILULÆ CAMPHORÆ COMP. (BRESA.)  
 R Camphoræ ʒj.; Potassæ Nitratis ʒij.; Kernis Mi-  
 neralis gr. vj.; Pulv. Glycyrrh. et Mellis, ʒā q. s. M.  
 Divide in Pilulas xlvij., quarum capiat duas, tertîâ  
 quaque horâ.

- Form. 495. PILULÆ CAMPHORÆ ET IPECACUANHÆ.  
 R Pulv. Ipecacuanhæ Comp. gr. iv.; Camphoræ rasee gr. j.—ij.; Syrupi Papaveris q. s. M. Fiat Pilulæ ij., quartâ quâque horâ sumende.
- Form. 496. PILULÆ CAMPHORÆ ET NITRI.  
 R Camphoræ Subactæ, Potassæ Nitratis, aa gr. ij.—v.; Conservæ Rosar. q. s. M. Fiat Pilulæ ij. vel ij.
- Form. 497. PILULÆ CASTOREI TRIBALOGÆ.  
 R Opii gr. ss.; Castorei Rossici gr. vjss.; Pulveris Digitalis gr. j.; Syrupi q. s. Fiat Pilulæ duæ, bis vel ter die sumende. (In Spasmodic Asthma, and Dyspnœa.)
- Form. 498. PILULÆ CATHARTICÆ. (1.)  
 R Hydrarg. Chloridi gr. viij.; Extr. Res. Jalap. gr. xvj.; Gum. Guaiaci gr. xxiv.; Mucilag. Acaciæ q. s. M. Divide in Pilulas xij. Capiat binas vel tres pro re natâ.
- Form. 499. PILULÆ CATHARTICÆ. (2.)  
 R Cambogiæ Gum. 5jss.; Scammon. 3j.; solve terendo in pauxillo Olei Junip.; dein adde Aloës Socot. 3ijss.; Gum. Ammoniaci 5jss.; Potassæ Sulphatis 3j.; Oxymellis Scillæ q. s. ut fiat massa equalis. Capiat pro dose gr. x. ad gr. xxx.
- Form. 500. PILULÆ COLOCYNTHIDIS COMPOSITE.  
 R Colocyntidis Pulpæ 3ss.; Aloës Spicatæ Extracti, Scammonæ Gummi Resinæ, aa 5j.; Saponis Duri 5ij.; Olei Caryophylli 3j. Aloë, Scammonia, et Colocyntidis pulpa in pulverem redigantur; tum cum Sapone atque Oleo conterantur; denique cum Mucilagine Acaciæ subigantur in massam.
- Form. 501. PILULÆ COLOCYNTHIDIS CUM HYDRARGYRO.  
 R Massæ Pil. Colocynt. Composit. 3iv.; Hydrargyri Chloridi (Calomel) 5j. Simul contunde in mortario lapideo, donec massa equalis sit; et in Pilulas lx. equalis distribuenda. Dosis, ab j. ad iv. pro re natâ.
- Form. 502. PILULÆ CUPRI SULPHATIS CUM OPIO.  
 R Cupri Sulphatis gr. vj.; Opii Puri gr. iv.; Pulv. Tragacanthæ Comp. 3j.; Mucilag. Acaciæ q. s. ut fiat Pilulæ xij.; quarum capiat unam ter die, postea quater quotidie, vel tertius aut quartis horis. (Chronic Diarrhœa and Dysentery.)
- Form. 503. PILULÆ DEOBSTRUENTES. (1.)  
 R Antimonii Potassio-Tartratis gr. iv.; Pilul. Hydrarg. 3j.; Saponis Castil. Gum. Ammoniaci, Assafoetidæ, Extr. Aloës Purif., aa 5jss. Misce bene, et divide in Pilulas lxxv., quarum capiat binas ter die.
- Form. 504. PILULÆ DEOBSTRUENTES. (2.)  
 R Extr. Aquosi Aloës 3ij.; Gum. Ammoniaci 3ij.; Myrrhæ, Mastichæ, Benzoini, Rhei, aa 3j.; Croci Stigm. gr. xvj.; Potassæ Carbon. 3ijss.; Mellis q. s. ut fiat massa equalis. Capiat gr. x. ad xx. pro re natâ.
- Form. 505. PILULÆ DEOBSTRUENTES. (BARTHEZ.) (3.)  
 R Kermis Mineral. gr. j.; Hydrarg. Chloridi gr. ij.; Extr. Fumariæ (vel Extr. Taraxaci) gr. x. Fiat Pilulæ ij. pro dose.
- Form. 506. PILULÆ DEOBSTRUENTES. (RECAMIER.) (4.)  
 R Saponis Castil. 3ijss.; Gum. Ammoniaci 5j.; Aloës Extr. Purif. gr. xv.; Assafoetidæ 5ss.; Pulv. Rhei 5j.; Croci Sativi 5ss.; Syrupi q. s. M. Fiat Pilulæ lxxxiv., quarum capiat binas bis quotidie.
- Form. 507. PILULÆ DEOBSTRUENTES. (5.)  
 R Saponis Hisp. 5ij.; Gum. Ammoniaci 5j.; Aloës 5j.; Rhei Pulv. 5j.; Assafoetidæ, Croci, aa 3ss.; Syrupi q. s. M. Divide in Pilulas c. Capiat binas ad quatuor, bis terve in die.
- Form. 508. PILULÆ DEOBSTRUENTES. (6.)  
 R Saponis Medicinalis 5iv.; Gum. Ammoniaci 3ij.; Extracti Conil. Extr. Aconiti Paniculati, aa 5jss.; Massæ Pilulæ Aloës cum Myrrhâ 5j. Contunde in massam equalem, et divide in Pilulas granarum quatuor, Capiat binas mane nocteque, augendo unam quotidie donec xv. vel xx. sumantur in die. (Dr. LOWESSY, in Glandular Tumours and Scirrhus Formations.)
- Form. 509. PILULÆ DEOBSTRUENTES. (STOLL.) (7.)  
 R Antimonii Oxysulphuret 3j.; Saponis Veneti 3ij.; Gummi Acaciæ 5j.; Mucilag. Gum. Tragacanthæ q. s. Fiat Pilulæ L. Sumat tres mane et nocte. (For Cutaneous Eruptions, Rheumatism, &c.)
- Form. 510. PILULÆ DEOBSTRUENTES. (8.)  
 R Hydrarg. cum Cremâ gr. xvj.; Sodæ Carbon. exsic. 3ij.; Extracti Taraxaci 5j. M. Fiat Pilulæ xx., quarum capiat duas vel tres omni nocte.
- Form. 511. PILULÆ BINIODIDI HYDRARGYRI.  
 R Hydrarg. Biniodidi gr. ij.; Extr. Humuli 3ij.; Pulv. Glycyrr. q. s. Misce bene, et divide in Pilulas xvj., quarum capiat binas mane nocteque, et augeri deorsum ad tres vel quatuor.
- Form. 512. PILULÆ DIAPHORETICÆ.  
 R Oxidi Zinci, Extracti Aconiti, aa gr. xij.; Antimonii Oxysulphuret gr. vj.; Extracti Humuli 3j.; Syrupi Papaveris q. s. Contunde bene simul, et divide in Pilulas xvij., quarum capiat unam, secundâ vel tertiâ quâque horâ. (In Chorea, Sciatica, Hysteria, and Rheumatism.)
- Form. 513. PILULÆ DIAPHORETICÆ SEDATIVE.  
 R Kermis Mineral., Extr. Opii, aa gr. ij.; Potassæ Nitratis gr. v.; Syrupi q. s. Fiat Pilulæ ij. pro dose.
- Form. 514. PILULÆ DIGITALIS ET CAMPHORÆ COMP.  
 R Pulveris Digitalis gr. vj.; Camphoræ gr. xv.; Extracti Hyoscyami 9jss. Fiat Pilulæ duodecim. Sumat tres omni nocte. (In Maniacal and Spasmodic Affections.)
- Form. 515. PILULÆ DIGITALIS ET MYRRHÆ COMP.  
 R Myrrhæ G. R. gr. ij.—iv.; Pulv. Digitalis gr. j.; Extr. Hyoscyami gr. ij.—v.; Syrupi q. s. Fiat Pilulæ ij., bis terve quotidie sumende.
- Form. 516. PILULÆ DIURETICÆ.  
 R Scillæ Rad. pulver. gr. ij.; Pulv. Foliorum Digitalis gr. j.; Pilulæ Hydrargyri gr. vj.; Olibani pulver. 3ss.; Olei Juniperi ʒij. Fiat massa in Pilulas quatuor dividenda, è quibus capiat ij. horâ somni, superbibendo haustulum Misturæ Diureticæ, No. 398, vel 399.
- Form. 517. PILULÆ DIURETICÆ ALTERNATIVE.  
 R Potassæ Bitart. 3j.; Biboratis Sodæ 5jss.; Pulv. Rad. Polygalæ Senegæ 5j.; Pulv. Radicis Calchæ exsic. 3ij.; Pulv. Scillæ gr. xvj.; Extr. Taraxaci 3ij. Fiat massa equalis, et divide in Pilulas c., quarum capiat tres, ter quotidie.
- Form. 518. PILULÆ DULCARIÆ ET ANTIMONII.  
 R Antimonii Sesquisulphuret, Pulv. Stip. Dulcariæ, aa 5j.; Extr. Dulcariæ 3ij.; Syrupi Totantani c. s. M. Fiat Pilulæ lx. (RICHTER, in Scrofula. Also in Cutaneous Diseases.)
- Form. 519. PILULÆ EMBMENAGOGÆ.  
 R Aloës Socot., Myrrhæ, aa 5jss.; Galbani, Gum. Ammoniaci, aa 3ij.; Biboratis Sodæ 5jss.; Ferri Sulphatis 5ss.; Ferri Sesquioxidi 3j.; Pulv. Rhei 3ij.; Olei Rutæ et Olei Sabinæ aa ʒij.; Saponis q. s. Fiat massa equalis, et divide in Pilulas cxx., quarum capiat duas vel tres, bis terve quotidie.
- Form. 520. PILULÆ EXTR. GENTIANÆ ET HUMULI COMP.  
 R Extracti Gentianæ 3ij.; Saponis Medicin. 5jss.; Fell. Bovini inspiss., Ext. Aloës Purif., aa 5j.; Extr. Humuli 5jss. Misce, et divide in Pilulas pond. gr. ij., quarum capiat binas vel tres mane nocteque.
- Form. 521. PILULÆ FERRI AMMONIO-CHLORIDI.  
 R Ferri Ammonio-Chloridi 3j.; Extracti Aloës, Extracti Gentianæ, aa 5ss. Contunde simul, et divide massam in Pilulas triginta, quarum sumat duas ter quotidie. (In Dyspepsia, Hysteria, Scrofula, and Mesenteric Obstructions.)
- Form. 522. PILULÆ FERRI AMMONIO-CHLORIDI.  
 R Ferri Ammonio-Chloridi 3j.; Extr. Gentian. et Ext. Aloës aa 3ij. Contunde simul, et divide massam in Pil. xxxj.; è quibus binas, bis terve quotidie, sumantur.

- Form. 523. **PILULÆ FERRI APERIENTES. (1.)**  
 R Ferrī Sulphatis, Potassæ Sulphatis, āā ʒ j.; Galbani, Assafetidae, āā ʒ jss.; Ammoniac Hydrochlorat. ʒ ij.; Massæ Pilul. Aloës cum Myrrha ʒ ij.; Theriacæ Purif. q. s. Contunde in massam æqualem, et divide in Pilulas cl., quarum capiat binas bis terve quotidie.
- Form. 524. **PILULÆ FERRI APERIENTES. (2.)**  
 R Ferrī Sulphatis, Potassæ Sulphatis, āā ʒ j.; Galbani, Assafetidae, āā ʒ jss.; Extr. Gentianæ ʒ ij.; Massæ Pilul. Aloës cum Myrrha ʒ ij.; Theriacæ Purif. q. s. Contunde in massam æqualem, et divide in Pilulas cl.
- Form. 525. **PILULÆ GUAIACI COMP. (1.)**  
 R Gum. Guaiaci ʒ ij.; Saponis Venet. ʒ j.; Calomelanos, Antimonii Oxy sulphureti, Pulv. Rad. Senegæ, Camphoræ, āā gr. xv.; Aceti Scillæ q. s. Fiat massa æqualis, et divide in Pilulas lxxx., quarum capiat duas vel tres bis terve quotidie.
- Form. 526. **PILULÆ GUAIACI COMP. (2.)**  
 R Gum. Guaiaci ʒ ij.; Calomel., Antimonii Oxy sulphureti, āā ʒ ss.; Mucilag. Acaciæ q. s. M. Fiant Pilule lx. Capiat ij.—iv. pro dosē. (In Cutaneous Affections.)
- Form. 527. **PILULÆ GUAIACI COMPOSITÆ. (3.)**  
 R Guaiaci Gummi Resinæ pulv. ʒ ij.; Pulv. Opii Crudi gr. vj.; Hydrargyri Chloridi (Calomel) gr. xij.; Antimonii Potassio-Tartratis gr. iv.; Tincturæ Myrrhæ q. s. ut fiat massa, in Pilulas xxxvj. dividenda. Dosis, ij. vel ij. nocte maneque.
- Form. 528. **PILULÆ GUAIACI ET ANTIMONII COMP.**  
 R Pulv. Jacobi Veri ʒ j.; Resin. Guaiaci in Pulv., Massæ Pilulæ Aloës cum Myrrha, āā ʒ jss.; Syrupi Simp. q. s. Fiat massa æqualis, et divide in Pilulas xlvij. Capiat binas ad quatuor pro dosē. (Emmenagogue, Stomachic, Aperient, and Antirheumatic.)
- Form. 529. **PILULÆ HELLEBORI ET ALOES COMP.**  
 R Extr. Rad. Hellebor. Nig., Aloës Ext. Purif., Ferrī Ammonio-Chloridi, āā ʒ j.; Croci Stigmat. ʒ ss.; Opii Puri gr. v.; Syrupi q. s. M. Fiant Pilule l., quarum capiat binas vel tres.
- Form. 530. **PILULÆ HYDRARGYRI ANODYNE.**  
 R Pilul. Hydrargyri, Pulveris Ipecacuanhæ Compos., Extracti Hyocyami, āā gr. v. Fiat massa, in Pilulas ij. dividenda. Sumatur horā somni.
- Form. 531. **PILULÆ HYDRARGYRI BICHLORIDI.**  
 R Hydrargyri Bichloridi, Ammoniac Hydrochlorat., āā gr. v.; Aquæ Destillatæ ʒ ss.; Glycyrrhizæ Radicis Pulveris ʒ iv.; Mellis Opt. ʒ ss.; Pulv. Acaciæ q. s. ut fiat massa, quam divide in Pil. xl.; è quibus sumatur una-ter die.
- Form. 532. **PIL. HYDRARGYRI PHOSPHATIS COMPOSITÆ.**  
 R Hydrargyri Phosphatis gr. ix.; Antimonii Pot.-Tartratis, gr. j.; Opii Crudi in pulv. subtiliss. gr. vj.; Confectionis Fructūs Rosæ Caninæ q. s. ut fiat massa, in Pilulas sex æquales distribuenda, quarum una horā decubitūs sumenda.
- Form. 533. **PILULÆ HYDRARGYRI ET SCILLÆ.**  
 R Sodæ Carbon. exsic. ʒ ss.; Saponis Duri ʒ ij.; Pilulæ Hydragr. gr. xxiv.; Pulv. Scillæ Rad. exsic. gr. xij.; Olei Juniperi q. s. M. Fiant Pilulæ xxiv., quarum capiat unam ter die.
- Form. 534. **PILULÆ HYDRARGYRI CHLORIDI COMPOSITÆ, SEU PILULÆ PLUMBERI.**  
 R Hydrargyri Chloridi ʒ ss.; Antimonii Oxy sulphureti ʒ j.; Guaiaci Gummi Resinæ contritæ ʒ ij.; Saponis ʒ ss.; Olei Juniperi, ℥ xxx.; Theriacæ Purificatæ (Trencle) q. s. ut fiat massa, in Pilulas sexaginta dividenda.
- Form. 535. **PILULÆ FERRI IODIDI.**  
 R Ferrī Iodidi gr. xxx.; Croci Stigm. pulveriz. ʒ j.; Sacchari Albi ʒ ij.; Mucilag. Tragacanth. q. s. Misce. Contunde in massam æqualem, et divide in Pilulas xc.; quarum capiat unam binas, vel tres, bis terve quotidie. (In Chlorosis, Amenorrhœa, Scrofula, &c.)
- Form. 536. **PILULÆ KINO COMPOSITÆ.**  
 R Kino ʒ ij.; Camphoræ rasæ et subactæ ʒ ss.; Oxidi Zinci ʒ ss.; Confect. Aromat. ʒ j. M. Divide in Pilulas xx. Capiat binas mane nocteque. (AUGUSTIN in Diabete. Also in Affections of Mucous Surfaces.)
- Form. 537. **PILULÆ MORPHIÆ CUM DIGITALE.**  
 R Morphicæ Acetatis gr. j.; Pulv. Fol. Digitalis gr. vj.; Camphoræ rasæ gr. x.; Pulv. Acaciæ gr. viij.; Syrupi Tolutani q. s. Fiat massa æqualis. Divide in Pilulas vj., quarum capiat unam tertis horis.
- Form. 538. **PILULÆ MYRRHÆ ET BALSAMI COMP.**  
 R Myrrhæ ʒ jss.; Benzoini ʒ ij.; Balsami Copaibæ ʒ j.; Extr. Glycyrrh. ʒ iv. Fiant Pilule lxiv. secundum artem. Capiat æger binas bis terve quotidie. (For Asthma, Chronic Bronchitis, &c.)
- Form. 539. **PILULÆ NERVINE. (STOLL.)**  
 R Gummi Ammoniaci, Gummi Assafetidae, aa ʒ jss.; Saponis Venet. ʒ ss.; Pulv. Castorei, Ammoniac Sesquicarbon., āā gr. xxv.; Mucilag. Acaciæ q. s. M. Fiant Pilulæ lxxx.; è quibus sumatur binas tertis vel quartis horis, vel ter die.
- Form. 540. **PILULÆ NERVINE ANTIMONIATÆ.**  
 R Gummi Galbani ʒ jss.; Gummi Sagapeni, Saponis Venetian., āā ʒ j.; Pulv. Rhei ʒ ss.; Antimon. Potassio-Tart. in Aqua Font. q. s. sol. gr. vj.—x.; Ext. Glycyrrh. ʒ j. Misce. Fiant Pilulæ gr. ij.; sumat unam ad tres ter quotidie.
- Form. 541. **PILULÆ NUCIS VOMICÆ.**  
 R Extr. Res. Nucis Vomicæ ʒ ss.; G. R. Assafetidae gr. ʒ jss.; Syrupi q. s. Fiat massa æqualis, et divide in Pilulas xxx. Capiat unam bis terve in die. (Cardialgia Spasmodica, &c.)
- Form. 542. **PILULÆ NUCIS VOMICÆ COMPOSITÆ.**  
 R Morphicæ Acetatis gr. j.; Ext. Nucis Vomicæ gr. ij.; Olei Olivæ gr. x. Solve; et adde Extr. Rad. Hellebori Nig. (Ed. Ph.) ʒ j.; Pulv. Glycyrrh. gr. viij.; Mellis q. s. Fiat massa æqualis, et divide in Pilulas xj.; quarum capiat unam bis terve in die. (In Chlorosis, Amenorrhœa, &c.)
- Form. 543. **PILULÆ CUM OLEO CROTONIS.**  
 R Pilul. Aloës cum Myrrha ʒ jss.; Saponis Castil. ʒ j.; Olei Crotonis Tigili ℥ vj.; Pulv. Glycyrrhizæ q. s. M. Fiant Pilulæ xxx. Capiat duas vel tres omni nocte. (In Amenorrhœa.)
- Form. 544. **PILULÆ PLUMBI ACETATIS ET DIGITALIS.**  
 R Plumbi Acetatis gr. iv.; Pulveris Digitalis gr. vj.; Pulveris Opii gr. ij.; Confectionis Rosæ Caninæ q. s. Misce, et divide in Pilulas sex æquales, quarum sumatur una ter in die.
- Form. 545. **PILULÆ PLUMBI ACETATIS ET COLCHICI.**  
 R Plumbi Acetatis gr. xj.; Pulveris Colchici gr. xxv.; Pulveris Opii gr. ij.; Mucilaginis Acaciæ q. s. Misce optimè, et divide in Pilulas æquales duodecim. (In active Hemorrhages, in Phtisis, &c.)
- Form. 546. **PILULÆ PLUMBI ACETATIS.**  
 R Plumbi Acetatis gr. viij.—xvj.; Opii Crudi pulv. gr. iv.; Confect. Fruct. Rosæ Caninæ q. s. In Pilulas viij. divide. Dosis, j. ij. vel ij. semel, bis, septies in die.
- Form. 547. **PILULÆ PURGANTES.**  
 R Fel. Tauri inspissat., Aloës Extr. Purificat., āā ʒ j.; Extr. Colocynth. Comp., Saponis Castil., āā ʒ j. M. Fiant Pilulæ xxxvj.
- Form. 548. **PILULÆ RHEI RESOLVENTIS.**  
 R Pulv. Rhei, Sodæ Acetatis, Fellis Bovini inspiss., āā ʒ ij.; Pulv. Gum. Acaciæ q. s. Fiat massa Pilularis. (Ph. Dan.)
- Form. 549. **PILULÆ RHEI BALSAMICÆ.**  
 R Pulv. Rhei, Pulv. Gum. Acaciæ, āā partes æquales; Balsam. Copaibæ q. s. ut fiat massa pilularis.
- Form. 550. **PILULÆ SCAMMONIÆ.**  
 R G. R. Scammon. gr. xv.; Sacchar. Albi gr. x. Tere probe; delude adde Ol. Carul ℥ iv. Fiant Pilulæ vj., quarum sumat ij. omni horā.

## Form. 551. PILULÆ SCILLÆ COMPOSITÆ.

R. Rad. Scillæ recent. 3 ss.; Gum. Ammoniaci, Succii Glycyrrh., aa 5j.; Antimonii Oxysulphureti, Pulv. Nacis Myristicæ, aa ʒj.; Syrupi Papaveris q. s. M. Fiant Pilulæ l., quarum capiat binas ad tres, ter quaterve in die.

## Form. 552. PILULÆ SCILLÆ COMPOSITÆ.

R. Scillæ Radicis Pulveris, Zingiberis Radicis Pulveris, aa 5j.; Ipecacuanbæ Radicis Pulv. 5 ss.; Saponis Duri, 3 jss.; Olei Juniperi ℥ xxx. Contunde, ut fiat massa, in Pilulas lx. dividenda.

## Form. 553. PILULÆ SEDATIVÆ. (1.)

R. Extr. Opii gr. j.; Nitratis Potassæ gr. vj.; Camphoræ rase gr. v.; Syrupi Papaveris q. s. ut fiant Pilulæ ij. pro dose.

## Form. 554. PILULÆ SEDATIVÆ. (2.)

R. Camphoræ Subactæ ʒ j.; Potassæ Nitratis 5 ss.; Extr. Hyoscyami, Extr. Anthemidis, aa ʒij.; Syrupi Papaveris q. s. M. Fiant Pilulæ xxxvj., quarum capiat duas 4tis vel 6tis horis.

## Form. 555. PILULÆ SEDATIVÆ. (3.)

R. Camphoræ rase et subactæ gr. x.; Extr. Hyoscyami ʒ j.; Extr. Papaveris Albi gr. xij. M. Divide in Pilulas xij., quarum capiat binas vel tres horâ somni.

## Form. 556. PIL. SODÆ SESQUICARBONATIS CUM HYOSCYAMO.

R. Camphoræ 5 ss.; (Sp. Rect. q. s. ft. terendo pulv.) Sodæ Sesquicarbonatis 3 jss.; Extracti Hyoscyami, ʒij.; Saponis Duri 3j.; Olei Juniperi ℥ xxx.; Pulveris Irid. Flor. q. s. ut ft. massa, in Pil. lx. æquales distribuenda; quarum sumat ij. nocte maneque, cum Infuso Limi vel Decocto Althææ.

## Form. 557. PILULÆ STAHLII.

R. Antimonii Sesquioxidi, Aloës Socot., Resin. Guaiaci, aa 3j.; Croci Stig., Myrrhæ 3 ss.; Bals. Peruv. q. s. ut fiat massa æqualis. Divide in Pilulas l.

## Form. 558. PILULÆ STOMACHICÆ. (1.)

(Grana Vitæ Mesue. — Frank's Grains of Health.)

R. Aloës 5 ij.; Mastiches, Petal. Rosæ Rub. aa ʒj.; Fellis Tauri inspissati 5 jss. Miscæ benè; divide in Pilulas c., quarum capiat ij. vel ij. ante prandium.

## Form. 559. PILULÆ STOMACHICÆ. (2.)

R. Extr. Gentianæ 5 ij.; Fellis Bovini inspiss. 5 jss.; Scammonie 5j. Contunde in massam æqualem, et divide in Pilulas lxxx.; quarum capiat binas quotidie, vel primo mane, vel ante prandium.

## Form. 560. PILULÆ STOMACHICÆ. (3.)

R. Limat. Ferri 3 ij.; Pulv. Canellæ 5j.; Fellis Bov. insp. 5 ss.; Syrup. q. s. M. Fiat massa Pilularis. (Chlorosis, &c.)

## Form. 561. PILULÆ STOMACHICÆ. (4.)

R. Limaturæ Ferri 3 j.; Pulv. Rhei, Extr. Gentianæ, Fellis Tauri insp., aa 5 ij. M. Fiat massa Pilularis.

## Form. 562. PILULÆ STOMACHICÆ. (5.)

R. Fellis Tauri inspissat., Extr. Aloës Purif., Extr. Gentianæ, Saponis Venet., aa 5 ss. M. Fiant Pilulæ xxx., quarum capiat binas bis in die.

## Form. 563. PILULÆ STOMACHICÆ APERTENTES.

R. Ext. Fumaricæ Officialinis, Extr. Jalapæ, aa 5j.; Pulv. Capsici Annui, gr. xvj.; Sodæ Carbon. exsic. 5 ss. Miscæ secundum artem, et divide in Pilulas xxxvj., quarum capiat duas vel tres horâ et semisse ante prandium.

## Form. 564. PILULÆ STRAMONII.

R. Extracti Stramonii ʒj.; Saponis Duri 5 ij.; Acaciæ Gummi Pulv. ʒj.; Glycyrrhizæ Radicis Pulv. ʒ ij.; Mucilag. Tragacanth. q. s. ut ft. massa, in Pilulas lx. dividenda. Dosis, j. nocte maneque, vel ter die.

## Form. 565. PILULÆ STRYCHNINÆ.

R. Strychninæ Purif. gr. ij.; Conserv. Rosarum ʒj. Miscæ benè, et divide in Pilulas xxv.

## Form. 566. PILULÆ STRYCHNINÆ COMPOSITÆ.

R. Strychninæ 3 jss.; Olibani, Benzoini, Croci, Extr. Glycyrrh., Mastiches, aa 5 ss.; Opii Puri ʒ ij.; Myrrhæ ʒ ij.; Balsami Tolutani ʒ j. Tere benè simul, ut sit massa æqualis. Divide in Pilulas lxxx., quarum capiat unam, binas, vel tres pro dose. (Each pill contains half a grain of opium.)

## Form. 567. PILULÆ SUDORIFICÆ. (1.)

R. Hydrargyri Chloridi (Calomel) gr. xij., Antimonii Potassio-Tart. gr. jss. ad gr. ij.; Opii Croci in pulv. subtiliss. gr. vj. Miscæ; tum adde Confect. Fruct. Rosæ Caninæ q. s. ut ft. massa. In Pilulas vj. æquales divide, quarum capiat j. horâ somni.

## Form. 568. PILULÆ SUDORIFICÆ (DUMERIL) (2.)

R. Kernis Mineral. (F. 637.), Antimonii Oxysulph. aa ʒj.; Extr. Opii gr. xij.; Extr. Hyoscyami 5j. Divide in Pilulas lx. Capiat j.—ij. bis terve in die.

## Form. 569. PILULÆ SULPHATIS STRYCHNINÆ.

R. Strychninæ Sulphatis gr. ij.; Confect. Rosar. 3j.; Miscæ probè, et divide in Pilulas xxvj. æquales. Capiat unam pro dose.

## Form. 570. PILULÆ TEREBINTHINATÆ.

R. Gum. Guaiaci 5j.; Terebinthinæ Vulg. 5jss.; Pulv. Glycyrrh. q. s. ut fiant Pilulæ xxxvj., quarum capiat binas vel tres, ter quotidie.

## Form. 571. PILULÆ TEREBINTHINÆ ET CAMPHORÆ CUM OPIO.

R. Extr. Opii ʒ j.; Pulv. Rad. Glycyrrh. 5 jss.; lxxx cum Aquæ pauxillo, et adde Terebinth. Venet. ʒ ij.; Camphoræ rase gr. xv.; Croci Stigmatis ʒ j.; Mastiches gr. x.; Pulv. Acaciæ gr. x.; Olei Juniperi q. s. Tere benè simul, et fiat massa æqualis. Divide in Pilulas lx., quarum capiat duas ad tres, bis terve quotidie.

## Form. 572. PILULÆ TONICÆ APERTENTES. (1.)

R. Quinæ Sulphatis 3 ss.—5 j.; Potassæ Sulphatis 3 jss.; Gum. Galbani ʒ iv.; Extr. Gentianæ, vel Anthemidis, 5j.; Massæ Pilulæ Aloës cum Myrrhâ 5 ij.; Theriacæ Purif. q. s. Contunde in massam æqualem, et divide in Pilulas cxx., quarum sumantur binæ vel tres, bis terve quotidie.

## Form. 573. PILULÆ TONICÆ APERTENTES. (2.)

R. Quinæ Sulphatis ʒ j.; Aloës Extr. Purif. ʒaa.; Extr. Gentianæ 5j. M. Fiant Pilulæ xxvj., quarum sumat unam vel binas, omni meridie.

## Form. 574. PILULÆ TONICÆ APERTENTES. (3.)

R. Ferri Sulphatis 5j.; Extracti Absinthii (Ex. Gentianæ), Extr. Aloës Purif., aa 3 jss.; Syrupi Croci q. s. M. Divide in Pilulas lxxxvj., quarum capiat binas, tres, quatuorve pro dose.

## Form. 575. PILULÆ TONICÆ APERTENTES. (4.)

R. Quinæ Sulphatis, Extr. Aloës Purif., aa ʒ ij.; Extr. Gentianæ, 5 jss.; Syrupi Simp. q. s. Divide in Pilulas xlviij.; quarum capiat duas vel tres pro dose.

## Form. 576. PILULÆ TONICÆ APERTENTES. (5.)

R. Quinæ Sulphatis ʒ j.; Massæ Pilulæ Aloës cum Myrrhâ ʒ ij.; Extr. Gentianæ 5j. M. Fiant Pilulæ xxx., quarum capiat binas bis quotidie.

## Form. 577. PILULÆ TONICÆ CUM CUPRO.

R. Cupri Sulphatis gr. x.; Pulv. Rhei 5j.; Extr. Anthemidis 5j.; Syrupi Simp. q. s. M. Fiant Pilulæ xl., quarum capiat j. ad ij. (In Leucorrhœa, &c. by AUGUSTIN; and in Gleet, Chorea, &c. The Ammonio-Sulphate of Copper is substituted for the Sulphate in Chorea by NIEMANN.)

## Form. 578. PILULÆ TONICÆ CUM SULPHATE ZINCI.

R. Zinci Sulphatis ʒ j.; Extracti Gentianæ ʒ iv.; Extr. Anthemidis ʒ ij. Contunde massam, et divide in Pilulas xl., quarum sumantur duæ bis die, cum Haustu infra scripto.

R. Infusi Gentianæ Compositi 5x.; Acidi Sulphuricæ Aromat. ℥ xij.; Tincturæ Zingiberis ʒ j. M. Fiat Haustus.

## Form. 579. PILULÆ TONICÆ EMMENAGOGÆ.

R. Quinæ Sulphatis, Massæ Pilul. Galban. Comp. ll 5 ss.; Massæ Pilulæ Aloës cum Myrrhâ 5j.; Olei Junip. Sabine q. s. M. Divide massam in Pilulas xxx., quarum capiat binas mane nocteque.

## Form. 580. PILULÆ URÆ URÆ ET RHEI.

R. Pulv. Uræ Uræ, Pulv. Rhei, aa 5 ss.; Saponis Castil. gr. xxv.; Mucilag. Acaciæ q. s. M. Fiant Pilulæ xx. Capiat duas bis quotidie.

## Form. 581. PILULÆ URÆ URÆ ET SODÆ.

R. Pulv. Fol. Uræ Uræ, Sodæ Carbon. exsic. Saponis Duri, aa 5j.; Mucilag. Acaciæ q. s. M. Fiant Pilulæ xl., quarum capiat binas bis terve quotidie.

## Form. 582. PILULÆ VALERIANÆ COMPOSITE.

R Pulv. Valerianæ gr. xxx.; Castorei gr. xx.; Oxidi Zinci gr. xx.; Syrupi Simp. q. s. M. Fiat Pilulæ xvij., quarum capiat tres, ter quotidie. (DUPUYTREN.)

## Form. 583. PILULÆ VALERIANÆ ET ZINCI.

R Pulv. Valerianæ ʒ ij.; Castorei gr. xv.; Oxidi Zinci ʒ j.; Olei Cajuputi ℥ v.; Syrup. Simp. q. s. Divide in Pilulas xvij., quarum capiat tres, quater in die. (Nearly the same as those used by DUPUYTREN.)

## Form. 584. PILULÆ ZINCI ET MYRRHÆ.

R Zinci Sulphatis gr. xij.; Myrrhæ in pulv. tritæ ʒjss.; Confect. Rosæ q. s. ut fiant Pilulæ xxiv.; ẽ quibus sumantur binæ, bis quotidie.

## Form. 585. PIL. ZINCI CUM MYRRHÆ ET IPECACUANHÆ.

R Zinci Sulphatis gr. xij.; Myrrhæ in pulv. trit. ʒ j.; Pulv. Ipecacuanhæ gr. xvij.; Extr. Hyoscyami ʒ ij.; Syrupi Papaveris q. s. M. Fiat Pilulæ xxix.; ẽ quibus sumatur una, ter quaterve quotidie.

## Form. 586. PILULÆ ZINCI SULPHATIS COMPOSITE. (1.)

R Zinci Sulphatis gr. xij.; Moschi ʒjss.; Camphoræ ʒ ss. M. et divide in Pilulas xxxvj., quarum sumantur duæ, bis vel ter in die.

## Form. 587. PILULÆ ZINCI SULPHATIS COMPOSITE. (2.)

R Zinci Sulphatis gr. xij.; Pulv. Ipecacuanhæ gr. vj.; Pulv. Myrrhæ ʒ ij.; Extr. Lactucæ ʒjss.; Syrupi Tolutani q. s. Contunde in massam æqualem, et divide in Pilulas xxiv.

## Form. 588. POTUS ANTIPHOLOG. DIURETICUS.

R Decocti Asparagi Officin. ℥ ij.; Potassæ Nit. ʒ ij.; Spirit. Ether. Nit. ʒ ij.; Oxymel. Scillæ ʒ ss. Sit pro Potu communi.

## Form. 589. POTUS DECOCTI SARZÆ COMP. (TISANE DE FELTZ.)

R Antimonii Oxysulphuret ʒ iv.; Aquæ Com. ℥ xvj.; Rad. Sarzæ ʒ ij.; Radicis Chinæ Orientalis, Corticis Lig. Buxi, Ichthyocollæ, aâ ʒjss.; Hydrarg. Bichloridi gr. ij. (Enclose the Antimony in a muslin bag; and boil the whole, excepting the Bichloride of Mercury, until the water is reduced to one half; strain the decoction, and add the Bichloride. The properties of this decoction will not be materially affected by omitting the Radix Chinæ and Cort. Buxi; or Sassafras or Guaiacum may be substituted, and Extractum Taraxaci added.)

## Form. 590. POTUS DIURETICUS. (1.)

R Decocti Tritici Repen. ℥ jss.; Potassæ Acetat. ʒjss.; Spirit. Ether. Nit. ʒ ij.; Aceti Colchici ʒ ss.; Vini Xeræ ʒ vj.; Oxymel. Scillæ ʒjss. Sit pro Potu communi.

## Form. 591. POTUS DIURETICUS. (2.)

R Decocti Tritici Repentis O jss.; Potassæ Bitart. ʒ j.; Potassæ Nit. ʒ ij.; Sodæ Bioratis ʒ ij.; Sacchari ʒ iv. Sit pro Potu ordinario.

## Form. 592. POTUS FERRIFUGUS. (1.)

R Potassæ Nitratis ʒ ij.; Serti Lactis O ij.; Succo Limonis ʒjss. M. Sumat pro Potu ordinario.

## Form. 593. POTUS FERRIFUGUS. (STOLL.) (2.)

R Pulpæ Tamarindorum ʒss. vel ʒ vj.; Potassæ Nitratis ʒ ij. vel ʒ ij.; Serti Lactis O jss. M. Omni bihorio sumatur vasculum coffeanum.

## Form. 594. POTUS MANNE ET TAMARINDORUM.

R Manna, Conservæ Tamarindi Indici, aâ ʒjss.; Serti Lactis ℥ jss. Digere et cola. Capiat cyathum subindè.

## Form. 595. POTUS REFRIGERANS.

R Acidi Hydrochlorici ʒ j.; Spirit. Ether. Nit. ʒ ijss.; Decocti Hordei Comp. ʒxxxij. M. Capiat cyathum pro re natâ. (In Febrile Affections.)

## Form. 596. PULVIS ACIDI BENZOICI ET CAMPHORÆ.

R Acidi Benzoici gr. vj.; Camphoræ gr. ij.; Sacchari Albi ʒ j. M. Fiat Pulvis. Dispens. tales doses tres. Capiat æger alterâ quaque horâ unum.

## Form. 597. PULVIS ALUMINÆ ET QUINÆ.

R Aluminæ Sulphatis gr. viij.—xij.; Quinæ Sulphatis gr. j.—ij.; Gum. Arab., Sacchar. Albi, aâ gr. xij. Fiat Pulvis. Dispens. tales duodecim. Capiat æger tertîâ quaque horâ pulverem unum. (In Adynamic Fevers, Hæmatemesis, Passive Hæmorrhages, &c.)

## Form. 598. PULVIS CUPRI AMMONIO-SULPHATIS CUM ZINCO.

R Cupri Ammonio-Sulphat., Oxidi Zinci, aâ gr. ss.—j.; Sacchari Albi gr. x. M. Fiat Pulvis. (In Epilepsy and Chorea.)

## Form. 599. PULVIS ANTHYDROPICUS.

R Potassæ Bitart. ʒ j.; Potassæ Nitratis, Bioratis Sodæ, aâ ʒ ij.; Pulv. Fol. Digitalis ʒ j. Tere benè simul, et divide in Chartulas xvj., quarum capiat unum bis terve quotidie, in quovis decocto vel infuso.

## Form. 600. PULVIS ANTIMONI ET CAMPHORÆ.

R Antim. Oxysulphuret, Radicis Ipecacuanhæ, aâ gr. j.; Camphoræ rasæ gr. j.—ij.; Sacchari Albi ʒ j. M. Fiat Pulvis. Dispens. tales doses sex; sumat æger alterâ quaque horâ Pulverem unum. (In Chronic Inflammations of the Respiratory Organs.)

## Form. 601. PULVIS ANTIMONIALIS COMPOSITUS.

R Pulveris Antimonii Comp. ʒ v.; Antimonii Oxysulphuret ʒ j. M. Dosis gr. v. pro ætate adultâ.

## Form. 602. PULVIS ANTIPHOLOGISTICUS.

R Potassæ Nitratis ʒ ij.; Potassæ Tartratis ʒ ivss.; Acidi Boracici ʒ j. Tere in pulv. subtiliss. (In doses of ʒ ss. in Cutaneous Affections, &c.)

## Form. 603. PULVIS ANTISPASMODICUS. (STARBU.)

R Kermis Mineral. gr. j.; Potassæ Nitratis, Potassæ Sulphatis, aâ gr. x. Miscæ benè.

## Form. 604. PULVIS APERIENS.

R Pulveris Jalapæ ʒ ij.; Hydrargyri Chloridi ʒ j.; Pulveris Zingiberis ʒ ij. Miscæ. Dosis, a gr. iv. ad gr. xx.

## Form. 605. PULVIS ASARI COMPOSITUS.

R Asari Follor. exsiccata ʒ ij.; Origanii Follor. exsiccata, Lavandulæ Florum exsiccata, aâ ʒ j. Simul terantur, et fiat Pulvis. (In Chronic Ophthalmia and Tooth-ach, as a sternutatory, &c.; to produce a secretion from the Schneiderian membrane.)

## Form. 606. PULVIS BELLADONNÆ.

R Pulv. Rad. Belladonnæ gr. iv.; Pulv. Rad. Glycyrrh. et Sacchari Albi aâ gr. xxvij. Tere benè simul. Dosis, gr. iv.—xx., bis in die.

## Form. 607. PULVIS BELLADONNÆ COMPOSITUS.

R Pulv. Rad. Belladonnæ gr. vj.; Pulv. Ipecacuanhæ gr. vj.; Pulv. Rad. Glycyrrh., Pulv. Sacchari Albi, aâ ʒ ss.; Sulphuris Præcipit. ʒ ij.; Olei Anisi, Olei Succini, aâ ℥ ij. Miscæ. In dosis gr. v.—xx.

## Form. 608. PULVIS BELLADONNÆ COMPOSITUS. (HECKER.)

R Pulv. Fol. Belladonnæ gr. j.—ij.; Moschi, Camphoræ, aâ gr. v.; Sacchari Albi ʒss. Tere benè, et divide in Chartulas viij. (Antispasmodic. For Pertussis, Asthma, &c.)

## Form. 609. PULVIS BISMUTHI.

R Bismuthi Trisnit. gr. ij.; Magnes. Calcinat., Sacchari Albi, aâ gr. x. M. Fiat Pulvis; tertîâ vel quartâ quaque horâ sumendus. (OBER.)

## Form. 610. PULVIS BISMUTHI COMPOSITUS.

R Bismuthi Trisnitrat., Moschi, aâ gr. ij.; Extr. Hyoscyami gr. ij.; Magnes. Carbon. gr. v. M. Fiat Pulvis, tertîâ quaque horâ sumendus. (MARCUS.)

## Form. 611. PULVIS BORACIS ET SABINÆ.

R Pulveris Follorum Sabinæ, Pulv. Zingiberis, aâ gr. vij.; Sodæ Bioratis ʒ j. Fiat Pulvis, bis die sumendus. (In Amenorrhœa with a languid pulse.)

## Form. 612. PULVIS CALOMELANOS CUM DIGITALE.

R Hydrargyri Chloridi, Sacchari Albi, aâ ʒ j.; Pulveris Digitalis ʒ ss. Miscæ. Dosis, a gr. j. ad gr. v.

## Form. 613. PULVIS CALUMBÆ COMPOSITUS.

R Pulveris Calumbæ ʒ j.; Pulv. Rheii ʒ ss.; Sodæ Carbonatis exsic. ʒjss. Miscæ. Dosis, a gr. vj. ad ʒ ss. bis de die.

## Form. 614. PULVIS CAMPHORÆ.

R Camphoræ 5 ss.; Sp. Rectif. q. s. Ft. terendo pulv.; dein add. Sacchari Purificati 5j.; Pulv. Acacie 5jss. M. Fiat Pulvis. In chart. x. æqualiter distribuendus.

## Form. 615. PULVIS CAMPHORÆ ET ZINCI.

R Camphoræ rase ʒj.; Zinci Oxidi gr. xv. M. In Chartulas iv. distribue; quarum sumat unam horâ somni. (In Epilepsy supervening about puberty, and connected with venereal desires and indulgences.)

## Form. 616. PULVIS CARMINATIVUS. (1.)

R Magnesie gr. viij.; Seminum Anisi contus., Seminum Fœniculi cont., ʒʒ gr. ij.; Sacchari Albi gr. viij. Contunde benè simul, et sit Pulvis. Capiat dimidium statim, et alterum post horam. (For the Termina of Infants, &c.)

## Form. 617. PULVIS CARMINATIVUS. (2.)

R Magnesie, Sacch. Albi, ʒʒ 5j.; Pulv. Corticis Canelle, Semin. Fœniculi cont., ʒʒ gr. xx.; Olei Anisi ℥ viij. Tere benè simul, et adde in Chartulas xij., quarum capiat unam bis terve quotidè, vel urgentibus torminibus.

## Form. 618. PULVIS CARMINATIVUS. (3.)

R Sem. Anisi, Sem. Carul, Sem. Coriand., Sem. Fœniculi, ʒʒ 5j.; Cort. Auram., Rad. Zingib., ʒʒ 5vj.; Crete Præpar. 3jss.; Magnesie 5 ss.; Macis 5jss.; Sacchari Albi 3lj.; tere benè simul. Dosis, 5j.—5lj.

## Form. 619. PULVIS CATHARTICUS.

R Hydrargyri Chloridi, Pulveris Cambogie, Pulv. Jalapæ, Pulv. Rhei, Pulv. Cinnamomi, ʒʒ 5lj. Misc. Dosis, ʒ gr. v. ad ʒj.

## Form. 620. PULVIS CINCHONÆ COMPOSITUS.

R Pulv. Cinchonæ 5jss.; Pulv. Moschl gr. xv.; Camphoræ ʒj.; Ammoniaci Sesquicarbon. gr. xxv.; Olei Succini et Olei Menthæ ʒʒ ℥ viij. Misc. probè, et divide in Pulv. viij.

## Form. 621. PULVIS CINCHONÆ CUM SODA.

R Pulveris Cinchonæ, Sodæ Carbonatæ, ʒʒ partes æquales. Dosis, ʒ gr. v. ad ʒss. bis terve in die.

## Form. 622. PULVIS CORTICIS CUSPARIÆ COMP.

R Pulv. Cort. Cuspariæ gr. x.; Pulv. Cinnam. Comp. gr. vj.; Olei Pimentæ ℥ ij. M. Fiat Pulvis, ter in die capiendus.

## Form. 623. PULVIS CRETÆ ET RHEI COMPOSITUS.

R Cretæ Præpar. 5 ss.; Saponis Amygdal., Pulv. Rhei, ʒʒ 5j.; Hydrarg. cum Cretâ ʒj.; Olei Fœniculi ℥ viij.; Sacchari Albi 3lj.; tere benè simul. Capiat gr. vj. ad 5 ss. pro dose bis vel ter die. (Pro Infantum Diarrhœa.)

## Form. 624. PULVIS CRETACUS.

R Cretæ Præparatæ, Acacie Gummi Ver. pulv., ʒʒ 3lv.; Sacchari Purificati contriti, 5lij. Misc. Ft. Pulvis.

## Form. 625. PULVIS CYANIDI ZINCI.

R Zinci Cyanidi gr. vj.; Magnesie Calcinatæ gr. lv.; Pulveris Cinnamomi gr. lv. M. Fiat Pulvis, quartâ quaque horâ sumendus. (In Gastrodynia, Dysmenorrhœa, Dyspepsia.)

## Form. 626. PULVIS DEOBSTRUENS.

R Gum. Guaiaci 5lj.; Flor. Sulphur. 3jss.; Calomelanos ʒj.; Radicis Iridis Flor., Semin. Fœniculi, ʒʒ 5jss.; Opii Extr. gr. ij.; Sacchar. Albi 3 ss. Tere benè simul, et divide in Pulv. vj.

## Form. 627. PULVIS DIURETICUS. (1.)

R Potassæ Nit., Potassæ Bitart., ʒʒ ʒlv.; Pulv. Scillæ gr. viij.; Pulv. Zing. gr. xvj. Misc. benè, et divide in Chartulas viij.

## Form. 628. PULVIS DIURETICUS. (2.)

R Potassæ Bitart. 5jss.; Pulv. Scillæ exsic. gr. ij.; Pulv. Digitalis gr. j.; Pulv. Zingiberis gr. v. Fiat Pulvis, ter quaterve quotidè sumendus ex theriacâ.

## Form. 629. PULVIS ECPHOTICUS.

R Potassæ Bitart. 3j.; Magnes. Carbon. Flor. Sulphur., ʒʒ 5 ss.; Potassæ Nit. 3lj. Misc. et divide in Chart. vj. (In Hemorrhoids, &c.)

## Form. 630. PULVIS ECPHOTICUS. (1.)

R Potassæ Bitart. 3 ss.; Sodæ Bihoratæ, Magnesie Carbon., ʒʒ 5lj.; Pulv. Flor. Anthemidis, Pulv. Semin. Fœniculi, ʒʒ 5lj.; Sacchari Albi 3 ss.; Olei Juniperi et Ol. Anisi ʒʒ ℥ viij. Tere benè simul. Capiat 5j.—5lj. bis terve quotidè.

## Form. 631. PULVIS ECPHOTICUS. (SELLII) (2.)

R Magnes. Carbon., Potassæ Bitart., Sulphuris Sublimati, Pulv. Rhei, Pulv. Flor. Anthemidis, Pulv. Seminum Fœniculi (vel potius Sacchari Albi 5 ss.; Olei Fœniculi Dul. ℥ xxiv.), ʒʒ 5 ss.; Olei Juniperi ℥ xvij. Tere benè simul. Capiat 3j.—5lj. bis terve quotidè ex vehiculo quovis idoneo. (In Obstructions, Jaundice, Piles, &c.)

## Form. 632. PULVIS EXCITANS.

R Bihoratæ Sodæ gr. xv.—ʒj.; Pulv. Sabinæ gr. vj.; Pulv. Castorei, Pulv. Rad. Zingib., ʒʒ gr. x. M. Fiat Pulvis. Sumat agra de die Pulveres blosos in vino vel cum melle. (Stimulans et emmenagogus in Menstruorum defectu ex Leucoplegmasiâ. HARTMAN.)

## Form. 633. PULVIS INFANTILIS.

R Rhei Radicis Pulveris 5lj.; Magnesie Carbonatæ 3x.; Zingiberis Rad. Pulv. 5 ss. M. Fiat Pulvis. Capiat gr. viij. ad 5 ss. pro dose.

## Form. 634. PULVIS IPECACUANHÆ CUM CALOSHELINÆ.

R Hydrargyri Chloridi 5lj.; Pulv. Ipecacuanhæ 5j.; Pulv. Cinnamomi 5jss.; Sacchari Albi 3℥ss. M. Dosis, ʒ gr. ij. ad gr. x.

## Form. 635. PULVIS JALAPÆ COMPOSITUS.

R Jalapæ Radicis Pulveris 5j.; Potassæ Bihoratæ 3lj.; Capsici Baccarum Pulv. gr. xij. Omnia, necsim trita, permisce. Dosis, ʒ 5 ss. ad 5j. et ʒss.

## Form. 636. PULVIS JALAPÆ ET CALOSHELINÆ.

R Pulv. Rad. Jalapæ gr. xv.—xx.; Hydrarg. Chlorid gr. ij.; tere probè cum Sacchar. Albi 5 ss.; et adde Pulv. Acacie ʒj.; Ol. Carul ℥ ij. M. Fiat Pulvis, statim sumendus.

## Form. 637. PULVIS KERMIS MINERALIS.

(Hydro-Sulphuret of Antimony. BERZELIUS.)

R Aquæ Pluvial. part. 280; Carbon. Sodæ part. 120; Sesquisulphuret Antimonii pulver. part. 6. Dissolve the Soda in the water whilst boiling; and boil the Sulphuret in the solution for half an hour, stirring it frequently. Filter the boiling liquor in a vessel containing warm water which had been previously boiled. Decant the water after it is cooled. Wash the precipitate which is formed, first with cold water, afterwards with warm water, until it passes off quite insipid. Lastly, press it, and dry it in the shade.\* (Stimulant, Emetic, Diaphoretic, Alterative, Resic, Expectorant. Dose j.—iv. gr.)

## Form. 638. PULVIS KERMIS MINERALIS ET CAMPHORÆ.

R Kermis Mineral. gr. ij.; Camphoræ subact. in Pulv. gr. ij.; Potassæ Nit. gr. v.—xj. M.

## Form. 639. PULVIS KERMIS MINERALIS CAMPHORATUS.

R Kermis Mineral. gr. ij.; Camphoræ pulverizatæ gr. viij.; Potassæ Nitratis gr. xxiv.; Sacchari Albi 5 ss. Tere benè, et divide in Pulv. iv. Capiat unam, quater in die.

## Form. 640. PULVIS LENITIVUS HYPOCHONDRIACUS.

(KLEIN.)

R Flavedinis Cort. Aurant., Pulv. Radicis Rhei, Potassæ Tartratis, ʒʒ 5 ss.; Olei Cajuputi ℥ ij. M. Ft. Pulvis pro unâ dose.

## Form. 641. PULVIS LIENTERICUS.

R Pulveris Tragacanthæ Comp., Pulv. Rhei, ʒʒ 5lj.; Pulv. Ipecacuanhæ Comp. 3j.; Hydrargyri cum Cretâ 5j. Misc. Dosis, ʒ gr. v. ad 5 ss. ʒss. bis, vel 6tis horis. Interdum adde Extractum Catechu, &c.

\* I have given the directions for this preparation, and a few others, in English, to prevent any mistake occurring in respect of them.

Form. 642. PULVIS NITRO-OPHATUS IPECACUANHÆ, *vel* PULVIS DOWERI.

R Ipecacuanhæ Radicis contrita 5j.; Opii Crudi contriti gr. xlv.; Potassæ Nitratis 5 viij. et gr. xv. Tere simul, et fiat Pulvis. (A scruple of this powder contains one grain and a half of opium, two grains of ipecacuanha, and sixteen grains and a half of nitrate of potass.)

Form. 643. PULVIS PURGANS.

R Hydrarg. Chlorid. Cambog. G. R. pulveriz., Pulv. Zingiberis, aa 5 ss.; Sacchari Purif. ʒj. Tere benè simul; et adde Olei Fœniculi Dulcis ℥ xx. Dosis, gr. v. ad xv.

Form. 644. PULVIS REFRIGERANS. (1.)

R Acid. Boracici ʒ ss.; Potassæ Nitratis ʒj.; Potassæ Bitart. ʒ ij. Misce benè. Capiat ʒj.—3j. pro dose.

Form. 645. PULVIS REFRIGERANS. (2.)

R Potassæ Bitartratis pulverizati uncias duas;—Nitratis drachmas tres. Misce, et divide in partes xij æquales.

Form. 646. PULVIS RESOLVENS, *vel* DEOBSTRUENS.

R Potassæ Bitartratis pulverizati ʒ lvs.; Sodæ Biboratis ʒjss.; Antimonii Potassio-Tart. gr. iij. Misce probè, et divide in partes æquales viginti.

Form. 647. PULVIS RHEI COMPOSITUS.

R Pulveris Rhei ʒiijss.; Hydrargyri cum Cretâ ʒj.; Potassæ Carbon. ʒjss.; Pulv. Cinnamomi ʒss. Misce. Dosis, à gr. v. ad ʒj. bis vel ter die.

Form. 648. PULVIS RHEI ET MAGNESIÆ.

R Pulv. Rhei ʒj.—5 ss.; Magn. Carb. gr. xvj.—5 ss.; Semin. Fœniculi, Sacchari Albi, aa gr. x.; Olei Cassiæ Cinnam. ℥j. M. Fiat Pulvis.

Form. 649. PULVIS RHEI ET SULPH. POTASSÆ.

R Pulv. Rhei gr. vj.—x.; Potassæ Sulphatis gr. x.—ʒj.; Pulv. Sem. Anisi gr. vj.; Olei Fœniculi ℥j. M. Fiat Pulvis, bis terve quotidie sumendus.

Form. 650. PULVIS SCAMMONIÆ CUM CALOMEL. (1.)

R Scammon. Gum. Resinæ pulv. ʒ ij.; Hydrarg. Chlorid. (Calomel). Sacchari Purificati, aa ʒj. M. Fiat Pulvis. Dosis, gr. x. ad gr. xx. manè.

Form. 651. PULVIS SCAMMONIÆ CUM CALOMEL. (2.)

R Scammon. Gummi Resinæ pulv., Hydrarg. Chlorid. Potassæ Bitart., aa ʒj. Misce benè simul, et sit Pulvis.

Form. 652. PULVIS SCAMMONIÆ ET JALAPÆ.

R G. R. Scammonia gr. xij.; Pulv. Rad. Jalapæ gr. xvij.; Potassæ Bitart. gr. xxv. Tere probè in pulverem tenuissimum; dein adde Pulv. Zingiberis gr. viij.; divide in partes tres æquales, quarum sumat j. secundâ vel tertiâ q. q. horâ, donec plenè dejecerit alvus.

Form. 653. PULVIS SEDATIVUS.

R Hydrarg. cum Cretâ ʒj.; Pulv. Ipecacuanhæ Comp. ʒ ij.; Magnesie Carbon. ʒ ss. Tere benè simul. Dosis, gr. iv.—xij., pro Infantibus.

Form. 654. PULVIS SENEGÆ ET CAMPHORÆ.

R Pulv. Rad. Senegæ, Sacch. Alb., aa gr. xij.; Camphoræ rasæ gr. ij.; Olei Anisi ℥j. M. Fiat Pulvis. Dispensentur tales doses tres. Capiat seger, interjectis duabus horis, pulverem unum. (In Chronic Affections of the Chest.)

Form. 655. PULVIS SODÆ COMPOSITUS.

R Sodæ Carbon. exsicc. ʒvj.; Hydrargyri Chlorid. ʒj.; Pulv. Cretæ Comp. ʒj. Misce. Dosis, à gr. v. ad ʒj.

Form. 656. PULVIS SODÆ CUM HYDRARGYRO.

R Sodæ Carbon. exsic. ʒiv.; Hydrarg. cum Cretâ ʒj. Misce benè. Dosis, gr. vj. ad gr. xij. pro Infantibus bis quotidie.

Form. 657. PULVIS SPECIFICUS STOMACHICUS. (POTERII.)

R Ferri Sesquioxidi, Antimonii Crudi, aa partes æquales vel unam; Potassæ Nitr. part. vj. Detona seu deflagra, et lava.

Form. 658. PULVIS SULPHATIS POTASSÆ ET FERRI.

R Ferri Sulphatis ʒvj.; Potassæ Sulphatis ʒij. Tere benè simul, et adde Acidi Sulphurici ℥ xxxvj. M. Dosis ʒj.—ʒjss. bis, ter, quaterve in die.

Form. 659. PULVIS SULPHATIS QUINÆ ANTIMONIATUS.

R Quinæ Sulphatis gr. xij.; Antimonii Potassio-Tartrat. gr. ij. Misce benè, et divide in partes vj. æquales. Capiat unam ʒdis vel ʒiis horas inter paroxysmos.

Form. 660. PULVIS SULPHATIS QUINÆ ET MORPHIÆ.

R Quinæ Sulphatis gr. iv.—xij.; Morphicæ Sulphatis gr. j.—ij. Misce, et divide in dos. iv. vel vj.

Form. 661. PULVIS SULPHURETI AUREATI ANTIMONII, *vel* DEUTO-SULPHURET. ANTIM. (BERZELIUS.)

R Liquoris restantis post præcipitat. Mineralis Kermes dict. quantum velis; infunde Acid. Aceticæ quantum sufficiat, vel donec nil amplius præcipitationis appareat. Lava benè materiam præcip. et exsicca. (N.B. The Oxysulphuret of Antimony of the Lond. Ph. is an admixture of Kermes Min. and the Golden Sulph.)

Form. 662. PULVIS TONICUS.

R Ferri Sulphatis exsiccatae ʒiij.; Potassæ Sulphatis ʒij.; Pulveris Cascarillæ ʒiijss. Misce. Dosis, à gr. ij. ad gr. xv. bis terve in die.

Form. 663. PULVERES TONICI.

R Pulv. Cinchonæ, Extr. Glycyrrh. aa ʒij.; Pulv. Rad. Valerian. ʒij.; Sacchari Albi ʒss. Tere benè simul, et divide in Chartulas ix. Capiat unam ter quotidie. (HELLER and NIEMANN.)

Form. 664. PULVERES TONICO-APERIENTES.

R Pulv. Cinchonæ ʒj.; Pulv. Rhei ʒiijss.; Ammonie Hydrochloratis ʒjss. Misce benè, et divide in Chartulas xij. (BANG et JADELOTT.)

Form. 665. PULVIS VALERIANÆ ET ZINCI.

R Valerianæ Pulv. ʒj.; Oxid. Zinci ʒj.; Moschi, Sacchari Purif., aa gr. x.; Olei Cajuputi ℥ij. Tere simul, et divide in Chartulas vj., quarum capiat unam ter die.

Form. 666. PULVIS ZINCI OXYDI COMPOSITUS.

R Oxidi Zinci gr. xij.; Magnesie Calcinatæ ʒss.; Pulv. Calumbæ ʒj. Tere benè simul, et divide in Chartulas xij., quarum capiat unam ter quaterve in die. (DE HAEN.)

Form. 667. PULV. ZINCI SULPHATIS COMP.

R Myrrhæ G. R. ʒj.; Pulv. Ipecac. gr. vj.; Zinci Sulphatis gr. vj.; Pulv. Glycyrrh., Sacchar. Alb. aa ʒjss. Tere optimè simul et fiat Pulvis. Divide in Chartulas ix., quarum capiat unam ter quaterve in die ex theriacâ.

Form. 668. SAPO OLEI CROTONIS TIGLII.

R Olei Crotonis Tiglii partes ij.; Lixivii Saponarii part. j. Contere, et fiat Sapo. Dosis, gr. ij. vel iij.

Form. 669. SAPO TEREBINTHINÆ.

R Potassæ Hydratis ʒj.; Liquefac lento igne, et adde Olei Terebinthinæ ʒij. Misce benè donec reflexerat. (Used both externally and internally.)

Form. 670. SAPO TEREBINTHINATA.

R Saponis Castil. ʒj.; Olei Terebinthinæ ʒjss.; adde Solutionis Potassæ Carbon. ʒij.; Camphoræ rasæ ʒij. Misce benè. (Used externally and internally.)

Form. 671. SOLUTIO IODINI. (LUGOL.)

R Iodini - - - - - No. 1. No. 2. No. 3.  
- - - - - gr. ij. gr. ij. gr. iv.  
Potassii Iodidi - - - - - gr. iv. gr. vj. gr. viij.  
Aque Destil. - - - - - ℥j. ℥j. ℥j.  
Solve. (Chiefly for external use; for injections in Scrofulous Fistule, &c.)

Form. 672. SOLUTIO IODINI CAUSTICA. (LUGOL.)

R Iodini ʒj.; Potassii Iodidi ʒj.; Aque Destillatæ ʒij. Solve.

Form. 673. SOLUTIO IODINI RUBEFACIENS. (LUGOL.)

R Iodini ʒiv.; Potassii Iodidi ʒj.; Aque Destillatæ ʒvj. Solve.

## Form. 674. SOLUTIO MORPHIÆ HYDROCHLORATIS.

R Morphiæ Hydrochlorat. gr. x.; Aq. Destillat. Calid. ℥ 1000. Solve. (Dose twenty-five minims — equal to  $\frac{1}{4}$  gr. of the Hydrochlorate.)

## Form. 675. SOLUTIO MORPHIÆ SULPHATIS.

R Sulphatis Morphicæ Ver. gr. iv.; Aquæ Destillatæ ʒj.; Solve. (Of the same strength as Laudanum.)

## Form. 676. SPIRITUS ÆTHERIS HYDROCHLORICI.

(Olim, Spiritus Febrifugi Cluttoni.)

R Acidi Sulphurici ℥j. ʒxij. (per pond.); Acidi Hydrochlorici ℥j. (per pond.); Spiritus Rectificati cong. j. Distilletur liquor, secundum artem.

## Form. 677. SPIRITUS AMMONIÆ ANISATIS.

R Olei Anisi ʒij.; Spirit. Ammoniac ʒvj. Solve.

## Form. 678. SPIRITUS CASTOREI AMMONIATUS.

R Castorei contr. ʒij.; Croci Stigm. ʒj.; Herbæ Artemisiæ ʒvj.; Potassæ Carbon. ʒij.; Spirit. Tenuioris ʒxxx. Macera per dies vij. et cola. Dein adde Spirit. Ammoniac. Liquoris Ammoniac. aa ʒvj. M. Dosis, ʒj.—ʒij.

## Form. 679. SPIRITUS CASTOREI COMP.

R Castorei contr. ʒij.; Croci Stigm. ʒj.; Herbæ Artemisiæ ʒvj.; Spirit. Tenuioris ℥jss. Macera per dies sex, et cola. Deinde adde Olei Anisi, Olei Juniperi, Olei Rutæ, aa ʒj. M. Dosis, ʒss.—ʒjss. ʒtis vel 4tis horis.

## Form. 680. SPIRITUS TEREBINTHINATUS.

R Olei Terebinthinæ ʒjss.; Spirit. Vini Rect. ʒvj. Distilla leni cum calore. Dosis, ℥vj.—xx. (In Jaundice.)

## Form. 681. SPIRITUS TEREBINTHINATUS COMP.

R Saponis Albi ʒij.; Opii ʒss.; Spirit. Vini Junip. (vulgò Hollandi) ʒxijss.; Spirit. Terebinth. Rect. ʒiv.; Camphoræ ʒvj. Macera bene, et cola. (Externally as a Liniment; and internally in Colicæ and Nephritic Complains, in doses of from 10 to 20 drops, and in Dropsics.)

## Form. 682. SUPPOSITORIUM OPIATUM.

R Opii Puri gr. ij.; Saponis Duri Hisp. gr. iv. Simul contunde, et fiat massa pro Supposito.

## Form. 683. SUPPOSITORIUM PLUMBI COMPOSITUM.

R Emplastrum Plumbi part. viij.; Abietis Resinæ cont. part. ij.; Opii Puri pulveriz. part. ss.—j. Solve Emplastrum et Resinam; deinde adde Opium, et forma in Supposit.

## Form. 684. SYRUPUS BELLADONNÆ.

R Fol. Belladonnæ ʒij.; Rad. Bellad. ʒj.; Sacchar. Albi ℥j. Aquæ q. s. ut sit Decocti ℥j.

## Form. 685. SYRUPUS MORPHIÆ ACETATIS.

R Morphicæ Acetatis gr. iv.; Syrupi Clarificati ʒxvj. Misce ut fiat Syrupus. (In doses of from two teaspoonful to a table-spoonful every three hours, or only at bed-time.)

## Form. 686. SYRUPUS MORPHIÆ SULPHATIS.

R Morphicæ Sulphatis gr. iv.; Syrupi Clarificati ʒxvj. Misce. (In the same doses as the Acetate. May be given alternately with the Acetate.)

## Form. 687. SYRUPUS PAPAVERIS.

R Extracti Papaveris Veri (in vacuo præp.) ʒj. Solve in Aquæ Destillatæ Ferrentis O. j.; cola, et adde Sacchari Purificati ℥jss.

## Form. 688. SYRUPUS POTASSII SULPHURETI.

R Potassii Sulphureti ʒj.; Aquæ Hyssopi vel Foeniculi ʒij. Solve, et adde Sacchar. Albi ʒiv.; et macera in balneo arenario.

## Form. 689. SYRUPUS QUININÆ.

R Syrupi Simplicis ʒviij.; Quinæ Sulphatis gr. xxxij. Capiat Cochlear. ij. minima, bis ter de die.

## Form. 690. SYRUPUS RHIZI COMPOSITUS.

R Rad. Rhei concisæ et contusæ ʒij.; Fol. Sennæ ʒij.; Canelle Corticis cont. ʒss.; Semin. Fœniculi cont. ʒj.; Potassæ Carbon. ʒij.; Rad. Zing. concis. ʒj.; Aquæ Ferrentis ℥ij. Macera per horas viginti quatuor loco in calido, et cola. Liq. colato adde Mannæ ʒij.; Sacch. Purif. ℥ijss. Fiat Syrupus.

## Form. 691. SYRUPUS SENNÆ ET MANNÆ.

R Fol. Sennæ ʒiv.; Semin. Fœniculi cont. ʒjss.; Sem. Anisi cont. ʒij.; Radicis Zingiberis ʒjss.; Aquæ Ferrentis O. ij. Digere per horas quatuor; exprime et cola. Dein colaturæ adde Mannæ Optime ʒvj.; Sacchari Albi ʒxxxj.; et fiat Syrupus.

## Form. 692. SYRUPUS SULPHURETI SODII.

R Sodæ Puræ (cum Alcoh. præp.) ʒj.; Aq. Destillat. ʒv.; Liquefac leni igne, et adde Sulphuris Puri quantum solvi potest.  
R Liquoris ʒj.; Syrupi Communis ʒxxxj. Misce bene in vase bene obturato. (Doses of ʒj.—ʒij. for infants, ʒj.—ʒij. for adults.)

## Form. 693. TINCTURA ACETATIS FERRI COMP.

R Acetatis Plumbi ʒss.; Ferri Sulph. ʒij.; Aceti, Alcoholis, aa ʒij.; Aq. Rosæ ʒvj. Solve Acet. Plumbi in Aceto cum lento igne; dein adde Sulph. Ferri in Pulv., cui post solutionem, infunde Alcohol. cum Aq. Rosæ permistum.

## Form. 694. TINCTURA ACETATIS MORPHIÆ COMPOSITA.

R Morphicæ Acetatis gr. xvj.; solve in Aquæ Destill. ʒij.; Acidi Acetici ℥v.; Tinct. Lavandul. Co. ʒvj.; Spirit. Myristicæ, vel Tinct. Cinnamon. Comp. ʒvij. M. Dosis, ℥x.—ʒj.

## Form. 695. TINCTURA ÆTHERIS VALESIANÆ.

R Radicis Valerian. pulver. ʒj.; Ætheris Sulphurici non-rectificat. ʒvj.; Alcohol. Rectif. ʒj. Macera per triduum et cola.

## Form. 696. TINCT. ALOETICA ALKALINA. (SAXON FR.)

R Croci Stigmat. in pulv. part. j.; Aloës Socot. in pulv. part. jss.; Myrrhæ pulv. part. ij.; Carb. Potassæ part. iv. Misce, et pose in locum humidum ut desiccet; dein infunde Aquæ Ferrentis part. xij. Macera per horas duodecim, et adde Alcoholis Concis. part. duodecim. Digere leni cum calore per dies tres, et cola. In dos. ʒss.—ʒjss.

## Form. 697. TINCTURA ALKALINA POTASSÆ.

R Potassæ Hydratis ʒss.; Alcoholi Concent. ʒiv. Macera per dies septem in balneo arenario.

## Form. 698. TINCTURA ALKALINA STIBIATÆ.

R Antimonii Crudi ʒj.; Potassæ Carbon. ʒij. Melt in a crucible, and reduce them to yellowish scoria; then powder them immediately in a hot iron mortar, and pour upon them rectified Alcohol ʒvj. Macerate for three days, and filter.

## Form. 699. TINCTURA AMARA.

R Aloës Socot. ʒiv. vel v.; Gum. Myrrhæ, Mastichæ, Benzoi, Rad. Calumbæ concis. aa ʒij.; Rad. Gentianæ ʒjss.; Croci Stigm. ʒj.; Spirit. Vini Gallici (Brandy) ℥ix.; Spirit. Vini Hollandici (Hollandic) ℥ij. Macera per mensem, et cola. (The celebrated "Droge Amère" of the Jesuits, and an excellent tonic and aperient.)

## Form. 700. TINCTURA AMMONIACI ALKALINA.

R Gummi Ammoniaci ʒij.; Liq. Potassæ Carbon. ʒjss.; Myrrhæ ʒj.; Alcoholis O. j. Macera per dies septem, et cola. Dosis, ʒss.—ʒjss.

## Form. 701. TINCTURA BALSAMICA. {1.}

R Olei Terebinthinæ ʒj.; Tinct. Myrrhæ ʒij.; Tinct. Benzoini Comp. ʒiv. Macera in loco calido. (Internally, and to Indolent Sores, &c.)

## Form. 702. TINCTURA BALSAMICA. {2.}

R Balsami Toluntani ʒss.; Balsami Peruvianæ, Symplicis Balsami, Acid. Benzoi, Myrrhæ, aa ʒij.; Croci Stigmat. ʒij.; Spirit. Vini Rect. ʒxxx. Macera per dies tres, et cola. (Wirtenburg Pâ. nostris.)

## FORM. 703. TINCTURA BALSAMI TOLUTANI.

R Balsami Tolutani ʒj.; Semin. Anisi cont. ʒj.; Acid Benzolici ʒss.; Spirit. Rectificat. Oj. Digere, donec solvatur Balsamum; dein cola.

## FORM. 704. TINCTURA BELLADONNÆ.

R Belladonnæ Foliorum exsiccatorum ʒij.; Spiritus Tenuioris Oj. Macera per dies quatuordecim, et cola.

## FORM. 705. TINCTURA BENZOICA ANODYNA.

R Camphoræ rasæ ʒjss.; Ipecacuanhæ, Balsami Tolutanti, aa ʒss.; Acidi Benzolici ʒij.; Opii Puri, Croci Stigm., aa ʒijss.; Olei Anisi ʒj.; Spirit. Vini Ten. lb. ij. Macera benè, et cola. Dosis, ℥vj.—xxx. (The Tinct. Opii Benzoica Compos. of the AUST. PHAR. and Tinct. Anodyno-Sudorific. of various foreign Pharmacopœias.)

## FORM. 706. TINCTURA BRUCIÆ.

R Bruciæ Puræ gr. xij.; Alcoholis (s. g. 837.) ʒj. Solve. (ʒj. contains gr. jss. of Brucine. Dose ʒss.—ʒij.)

## FORM. 707. TINCTURA CALAMI.

R Calami Radicis contusi ʒiv.; Spiritus Tenuioris Oij. Macera per dies quatuordecim, et per chartam cola.

## FORM. 708. TINCTURA CAMPHORÆ THEBAICÆ.

R Opii Pulveriz. ʒij.; Camphoræ ʒvj.; Corticis Canellæ contus., Croci Stigmat., aa ʒij.; Caryophyllorum, Pulv. Capsici, aa ʒjss.; Potassæ Carbon. ʒij.; Olei Anisi ʒjss.; Spirit. Vini Tenuior. (vel Sp. Vini Gallicæ, vel Sp. Vini Hollandi) Oij. Macera leni cum calore per dies viij. ad xj.; dein exprime et cola.

## FORM. 709. TINCTURA CARYOPHYLLOREM.

R Caryophyllorum contus. ʒij.; Spirit. Vini Tenuior. Oij. Macera benè, et cola.

## FORM. 710. TINCTURA CASCARILLÆ ALKALINA.

R Corticis Cascarillæ cont. ʒiv.; Potassæ Carbon. ʒss.; Spirit. Tenuior. lb. ij. Macera benè, et cola. Dosis, ʒj.—ʒij.

## FORM. 711. TINCTURA CASTOREI ALKALINA.

R Castorei contus. ʒij.; Potassæ Carbon. ʒij.; Croci Stigm. ʒij.; Spirit. Rorismarini lb. ij. Macera per triduum, et cola. M. Dosis, ʒss.—ʒij.

## FORM. 712. TINCTURA CENTAURI CACUMINUM.

R Centaurii Cacumin. (flowering tops of Centaury), ʒij.; Spiritus Tenuioris Oij. Digere per dies quatuordecim, et cola.

## FORM. 713. TINCTURA CINCHONIÆ SULPHATIS.

R Cinchonæ Sulphatis gr. xxxvj.; Alcoholis Rect. ʒij. Solve. Dosis, ʒj.—ʒij.

## FORM. 714. TINCTURA CONII.

R Conii Foliorum exsiccatorum ʒij.; Cardamomi Semin. contusorum ʒij.; Spiritus Tenuioris Oj. Digere per dies septem, et per chartam cola.

## FORM. 715. TINCTURA DIGITALIS ÆTHEREA.

R Fol. Digitalis exsic. et pulv. part. j.; Æther. Sulphur. part. iv. Macera per triduum, et cola. (Dosis, ℥xx.—xxx, ter die. Several Continental Pharmacopœias.)

## FORM. 716. TINCTURA DIOSMÆ CRENATÆ.

R Fol. Diosmæ Crenatæ ʒij.; Spirit. Tenuioris Oj. Macera per dies septem, et cola. (Dose ʒj.—ʒij.)

## FORM. 717. TINCTURA DIURETICA.

R Olei Juniperi ʒss.; Spirit. Ætheris Nitrici, Tincture Digitalis Æthericæ, aa ʒij. M. (Dosis, ʒss.—ʒj. ter quaterve in die. HUFELAND.)

## FORM. 718. TINCTURA FERRI ÆTHEREA.

R Acidi Hydrochlorici ʒij.; Acidi Nitrici Dilut. ʒjss.; Ferri Limaturæ q. s. Dissolve the iron in the acids; evaporate to dryness; afterwards deliquesce the residue by exposure to the air, and mix the deliquesced liquor with double its weight of Sulphuric Æther, agitating the mixture frequently until it assumes a golden yellow colour; then decant, and add double the quantity of rectified Alcohol. This Tincture may be used previously to the addition of the Alcohol, or subsequently. In the state of Æther the dose is from 16 to 20 drops; in that of Ætheral Tincture, from 20 to 30 drops. It is useful in Diseases of Debility, and in Spasmodic Affections.

## FORM. 719. TINCTURA FRUCTUS VANILLÆ.

R Fructus Vanillæ concis. et contus. part. j.; Alcoholis part. vj. Macera leni cum calore per dies octo, et cola. (Nervine, Anæsthetic, Excitant, &c. PFAFF.)

## FORM. 720. TINCTURA GALBANI COMPOSITA.

R Galbani Gummi Resinæ ʒjss.; Pimentæ Baccarum contus. ʒj.; Cardamomi Semin. contus. ʒss.; Spirit. Rectif. Oj.; Aquæ Destil. O ss. Macera per dies quatuordecim, et cola.

## FORM. 721. TINCTURA GALLÆ.

R Gallarum contus. ʒij.; Spirit. Tenuioris Oij. Macera per dies octo, et per chartam cola.

## FORM. 722. TINCTURA IODINII FORTIOR.

R Iodini ʒij.; Spirit. Rectificat. ʒj. Solve, terendo in vase vitreo. (ʒj. contains five grains of Iodine.) Dose ℥vj.—xxiv.

## FORM. 723. TINCTURA IODINII MITIOR.

R Iodini gr. xxiv.; Spirit. Rectif. ʒj. Solve, terendo in vase vitreo. M. (ʒj. contains gr. liij. of Iodine.)

## FORM. 724. TINCTURA LOBELIÆ INFLATÆ.

R Herb. Lobeliæ Inflatæ exsic. ʒij.; Spirit. Vini Ten. Oj. Digere per dies decem, et cola. (Emetic in doses of ʒj. to ʒij.; Antispasmodic in doses of ℥xx. to ʒss.; and Diuretic in smaller quantities.)

## FORM. 725. TINCTURA MYRRHÆ ALKALINA.

R Myrrhæ ʒj.; Potassæ Carb. ʒvj.; Aquæ Ferventis ʒij. Tere; dein macera in balneo aren. ad mellis crassitud., et adde Spirit. Tenuioris ʒx. Macera benè, et cola. Capiat ʒj.—ʒij. ex Infuso Anthemidis. (In Scrofula, &c.)

## FORM. 726. TINCTURA NERVOSA. (RIEMERH.)

R Spirit. Cornu Cervi Rect. part. lv.; adde gradatim Alcohol. Rect. part. xvj.; Camphoræ part. ij.; Olei Junip. partem j. Solve.

## FORM. 727. TINCTURA NUCIS VOMICÆ.

R Extracti Nucis Vomicæ exsic. gr. iv.; Alcoholis (36°) ʒj. Solve. (ʒj. Tincturæ ad gr. ss. Extracti.)

## FORM. 728. TINCTURA OPII CAMPHORATA.

(Sive *Élixir Paragoricum Pharm. Pristin.*)

R Camphoræ ʒij.; Opii Crud. in pulv., Acidi Benzolici, aa ʒj.; Olei Anisi ʒss.; Potassæ Carbon. ʒj. Omnia in mortario simul optimè terentur; paulatim affunde Spiritus Tenuioris Oij.; stent in digestionem per dies decem: tum adde Radicis Glycyrrhizæ incisæ ʒiv.; digere iterum per dies septem, et cola.

## FORM. 729. TINCTURA OPII COMPOSITA.

(Vel *Laudanum Liquidum Verum Sydenhamii.*)

R Opii Puri contrit. ʒij.; Croci ʒj.; Cort. Canellæ, Caryophyllorum, aa ʒjss.; Spirit. Vini Rect. ʒiv.; Vini Hispan. lb. ij. Macera cum leni calore per dies xvj.; dein exprime et cola. (℥xv. equal to 1 grain of pure opium.)

## FORM. 730. TINCTURA PHELLANDRII. (MARCUS.)

R Semin. Phellandrii Aq. ʒss.; Alcoholis ʒvj. Macera per horas xxiv., et adde Vini Burgundicæ ʒvj. Macera per dies tres, et cola. Capiat ℥x.—ix. (In Chronic Bronchial and Pulmonary Affections.)

## FORM. 731. TINCTURA QUINÆ SULPHATIS.

R Quinæ Sulphatis gr. viij.; Spiritus Vini ʒj. M. Fiat Tinctura.

## FORM. 732. TINCTURA QUINÆ SULPHATIS ACID.

R Quinæ Sulphatis gr. xlvij.; Tincture Aurantii Comp. ʒvss.; Acidi Sulphurici Dilut. ʒij. M. Fiat Tinctura. (Dosis, ʒss. ad ʒij.)

## FORM. 733. TINCTURA RHATANIÆ. (SPRAGUE.)

R Kramerie Radicis contus. ʒij.; Spiritus Tenuioris Oij. Digere per dies octo, et per chartam cola.

(This Tincture is strongly impregnated with the medicinal virtues of the root. It is a very grateful tonic, when given according to the following formula:—

R Infusi Rosæ ʒx.; Acid. Sulph. Aromat. ℥xv.; Tinct. Rhatanæ, Syrupi Rheodæ, aa ʒj. M. Fiat Haustus, ter in die hauriendus.)

## Form. 734. TINCTURA RHATANIE AROMATICA.

R Kramerie Radicis contusæ 3 ij.; Canelle Corticis contusæ 3 ij.; Spiritus Tenuioris O ij. Digere per dies decem, et per chartam cola.

The following is an agreeable method of exhibiting this tincture:—

R Infus Aurantii Compositi 3 vj.; Tinctura Rhatanie Aromat., Syrupi Zingiberis, aa 3 j. Misce. Fiat Mistura; cuius sumat coch. ampla ij. ter in die, urgente Languore vel Flatu. (SPRAGUE.)

## Form. 735. TINCTURA RHEI ANISATA.

R Radicis Rhei concisæ, Radicis Glycyrrhizæ concis., aa 3 ij.; Seminum Anisi contus., Sacchari Purif., aa 3 j.; Spiritus Tenuioris octario ij. Macera per dies quatuordecim, et cola.

## Form. 736. TINCTURA RHODII.

R Rhodii Ligni ras. 3 iv.; Spiritus Rectificati O j. Macera per dies quatuordecim, et per chartam cola.

## Form. 737. TINCTURA SABINE ALKALINA.

R Olei Essent. Sabine 3 ij.; Tinct. Alkaline 3 vij. et 3 ij. (F. 696.) Solve. Dosis, ℥xx.—xxx.

## Form. 738. TINCTURA SENNÆ AMARA.

R Fol. Sennæ part. vj.; Radicis Gentianæ concis. part. iv.; Corticis Aurantii exsic. part. ij.; Cardamom. Semin. contus. part. j.; Spirit. Vini Ten. partes xlv. Macera per dies quatuordecim, et cola.

## Form. 739. TINCTURA STRAMONII.

R Daturæ Stramonii Seminum contus. 3 ij.; Spiritus Tenuioris O j. Macera per dies quatuordecim, et cola.

## Form. 740. TINCTURA STRYCHNIE.

R Strychnie Puræ gr. ij.; Alcoholis (sp. gr. 838.) 3 j. Solve. Dosis, ℥ viij. ad xxx.

## Form. 741. TINCTURA TABACI.

R Fol. Nicot. Tabaci 3 ij.; Alcohol. Rect. O j. Macera per dies septem, exprime et cola.

## Form. 742. TINCTURA TABACI COMPOSITA.

R Tabaci Foliorum concis. 3 ss.; Camphoræ rasæ 5 ij.; Spirit. Rectif., Aquæ Destill., aa 3 iv. Macera per dies octo, et cola.

## Form. 743. TROCHISCUS CATECHU EXTRACTI.

R Catechu Extracti Pulv. 3 ij.; Cinnamomi Corticis in pulv. 3 jss.; Olei Cinnamomi ℥ v.; Sacchari Purificati 3 xiv.; Mucil. Tragacanthæ q. s. Fiat massa in Trochiscis formanda. (SPRAGUE.)

## Form. 744. TROCHISCUS IPECACUANHÆ.

R Ipecacuanhæ Radicis Pulv. 5 iv.; Sacchari Purificati ℥ ij.; Mucil. Tragacanthæ q. s. Misce secundum artem ut fiat Troch. 480. (Each lozenge contains half a grain of Ipecacuanha. In recent Coughs and in Diarrhoea.)

## Form. 745. TROCHISCUS LACTUÆ.

R Extract. Lactuæ Concentrat. (Probart's), Extracti Glycyrrhizæ, Pulv. Acaciæ Ver., aa 3 iv. Hæc optimè terantur simul, et cum Aquâ fiat massa, in Trochiscos formanda.

## Form. 746. TROCHISCI NITRO-CAMPHORATI.

R Extr. Opil gr. viij.; Camphoræ rasæ gr. xxvj.; Potassæ Nitratis 3 jss.; Sacchar. Purif. 3 ij.; Muellag. q. s. Misce benè, et divide in Tabulas l., quarum capiat vj.—x. per diem. (CHAUSSE.)

## Form. 747. TROCHISCUS POTASSÆ NITRATIS.

R Potassæ Nitratis Pulv. 3 iv.; Sacchari Purificati ℥ ij.; Hæc optimè terantur simul, et cum Mucil. Tragacanth. fiat massa in Trochiscos formanda.

## Form. 748. TROCHISCUS ZINCI SULPHATIS.

R Zinci Sulphatis Purif. 5 iv.; Sacchari Purificati ℥ ij. Hæc optimè terantur simul, et cum Mucil. Tragacanth. fiat massa in Trochiscos formanda. (This mass should be equally divided, so that each lozenge may contain gr.  $\frac{1}{2}$  of the Zinc.)

## Form. 749. UNGUENTUM ANTIMONII POTASSIO-TARTARATI, VEL FERRI-FUGUM. (1.)

R Antimoni Pot.-Tart. gr. xxv. Solve in Aquæ Destil. q. s.; deinde Antimoni Pot.-Tart. in pulv. sublim. rectificati 5 jss.; Adipis Preparat. 3 ss. Misce benè, et fiat Unguentum. (Produces Phlogosis, and its antimony is partially absorbed.)

## Form. 750. UNGUENTUM ANTIMONII POTASSIO-TARTARATI. (2.)

R Antimoni Pot.-Tart. in pulv. 5 j.; Adipis Preparat. 3 j.; Camphoræ rasæ et subact. 3 j.; Olei Caryoph. ℥ xv.; Moschi gr. ij. Misce benè.

## Form. 751. UNGUENTUM ANTIMONII POTASSIO-TARTARATI. (3.)

R Antimoni Pot.-Tart. 3 jss.; Adipis Preparat. 3 j.; Balsami Peruviani ℥ xv. M.

## Form. 752. UNGUENTUM ARGENTI NITRATIS.

R Argenti Nitrat. Pulv. gr. xl.; Adipis Preparat. 3 j. Liq. Plumbi Di-acet. 3 ij. M. Fiat Unguentum.

## Form. 753. UNGUENTUM BALSAMI PERUVIANI.

R Balsami Peruviani 5 j.; Unguenti Elemi Comp. 3 vj. Unguento balneo in aquoso liquefacto, adde Balsamum Peruvianum, et fiat Unguentum.

## Form. 754. UNGUENTUM BELLADONNÆ. (1.)

R Belladonnæ Fol. recent., Adipis Preparatæ aa 3 j. The leaves are to be bruised in a marble mortar; after which the lard is to be added, and the two incorporated by beating. They are then to be gently melted over the fire; and after being strained through a cloth, and the Belladonna well pressed, the sediment is to be stirred till quite cold. (SPRAGUE.)

## Form. 755. UNGUENTUM BELLADONNÆ. (CHAUSSE.) (2.)

R Ext. Belladonnæ 3 ij.; Aquæ Destil. 3 jss. Terceum Unguenti Simp., vel cum Axungia, 3 jss. M.

## Form. 756. UNGUENTUM CALOMELANOS ET CAMPHORÆ.

R Calomelanos, Camphoræ, aa 3 j.; Olei Caryoph. ℥ iv.; Unguent. Simp. 3 ij. M.

## Form. 757. UNGUENTUM CALOMELANOS CUM CAMPHORÆ.

R Calomelanos 3 j.; Camphoræ 3 j.; Unguenti Simp. (vel Ung. Sambuci Flor.) 5 vj. M. Fiat Unguentum.

## Form. 758. UNGUENTUM CAMPHORÆ COMPOSITUM.

R Saponis Albi ras. 3 jss.; Camphoræ rasæ 5 ij.; Olei Terebinthinæ 3 ss. Misce paulatim, et adde Liq. Ammonie 5 j. M.

## Form. 759. UNGUENTUM COMITIBUS.

R Olei Pimentæ, Olei Olivæ, aa 5 jss.; Cere Flave 3 j. Solve, et adde Pulv. Pimentæ 5 ij.; Pulv. Galliarum, Pulv. Nucis Cupressæ, Pulv. Senn., Pimentæ, Pulv. Fol. Toxicodend., aa 3 jss.; Sulphatis Aluminis 5 j.; Camphoræ rasæ 3 ij. Misce benè, et sit Unguentum.

## Form. 760. UNGUENTUM CUPRI ACETATIS.

R Cupri Acetatis, Hydrargyri Chlorid., aa 5 j.; Ceræ Resinæ 3 j.; Terebinthinæ Vulgaris 3 ss. Ligetur Resinæ Ceratum in balneo aquoso, et Terebinthinam adde; tunc Cupri Acetatem et Hydrargyri Chloridum (prius commistos) insperge, et omnia misce.

## Form. 761. UNGUENTUM DEORSTRUENS. (1.)

R Ammonie Hydrochlorat. pulverizat. 3 j.; Unguenti Hydrarg. Fort. 3 j.; Extr. Clivæ 3 jss. Misce benè, et fiat Unguentum. (Dr. HUNFELD. Tumors, Indurations, &c.)

## Form. 762. UNGUENTUM DEORSTRUENS. (2.)

R Unguenti Hydrarg. Fort. part. xlv.; Ammonie Hydrochlorat. pulveriz. part. vj. Misce benè. (M. DUPUYTREN.)

## Form. 763. UNGUENTUM GALLÆ OPIATI.

R Gallarum in pulv. subtil. 5 ij.; Opil Croci Pulver. 5 j. Unguenti Plumbi Acetatis 3 ij. M. Fiat Unguentum.

## Form. 764. UNGUENTUM GALLÆ OPIO-CAMPHORATUM.

R Pulv. Nucis Gallarum 5 j.; Camphoræ rasæ et subactæ in pauxillo Alcoholis 3 j.; Pulv. Opil Purif. Potassæ Nitratis pulveriz., aa 3 ss.; Adipis Preparatæ 3 ij.; Olei Pimentæ ℥ xlv. Misce benè, et sit Unguentum ter, quaterve in die applicandum.

Form. 765. UNGUENTUM HYPOCHLORIDIS SULPHURIS.  
 ℞ Sulphuris Hypochloridis ʒ j.; Unguenti SImplicis ʒ j.  
 Misce benè. (For Lepra, Psoriasis, and other Chronic  
 Eruptions.)

℞ Iodidi Hydrarg.	-	ʒ ij.	ʒ ij.
Adipis Sullæ recent.	-	ʒ ij.	ʒ ij.
Misce.			

Form. 770. UNGUENTUM IODIDI PLUMBI.  
 ℞ Iodidi Plumbi ʒ ij.—ʒ iij.; Adipis Sull. recentis præ-  
 par. ʒ ij. Misce.

Form. 771. UNGUENTUM NERVINUM.  
 ℞ Unguenti Althææ (vel Ung. Sambuci) ʒ iv.; Liq.  
 Ammoniac ʒ j.; Camphoræ, Petrolei, Spirit. Tere-  
 binth., aa ʒ ss.; Olei Rorismarini ʒ ij.; Olei Berga-  
 mii ʒ j. M. (HUFKLAND.)

Form. 772. UNGUENTUM POPULEUM.  
 ℞ Gemmæ vel Oculi, Populi Balsamiferæ vel Nigræ  
 contus. ℞ ss.; Butiri recentis ℞ j. Liquefac simul  
 lento igne, vel in balneo arenario, et exprime.

Form. 773. UNGUENTUM POPULEUM COMPOSITUM.  
 ℞ Gemmæ Populi Bals. vel Nig. recentis ℞ jss. Con-  
 tunde cum Adipis Præparat. ℞ ij., et adde Fol. re-  
 centis Hyoscyami Nigri, Fol. recentis Belladonnæ,  
 aa ʒ iv. Contunde simul, et macera lenti cum calore  
 donec disparat humiditas; dein exprime. (All the  
 German Pharmacopœias.)

Form. 774. UNGUENTUM AD PORRIGINEM. (1.)  
 ℞ Sulphuris Sublimati, Unguenti Pleis Liquidæ, aa  
 ʒ jss.; Saponis Mollis, Ammoniac Hydrochloratis,  
 aa ʒ ss. Misce. Fiat Unguentum.

Form. 775. UNGUENTUM AD PORRIGINEM. (2.)  
 ℞ Hydrargyri Chloridi ʒ ij.; Aluminis Exsiccati, Plumbi  
 Carbonatis, aa ʒ ss.; Terebinthine Venet. ʒ vj.;  
 Cerati Cetacei ʒ jss. Misce. Fiat Unguentum.

Form. 776. UNGUENTUM SULPHURETI IODINI.  
 ℞ Sulphureti Iodini gr. xv.—xxv.; Axungie ʒ j. M.

Form. 777. UNGUENTUM ZINCI IODATIS.  
 ℞ Zinci Iodatis ʒ j.; Adipis Præparatæ ʒ j. M.

Form. 778. VINUM ALOES ALKALINUM.  
 ℞ Aloës Socot., Croci Stigm., Myrrhæ, aa ʒ j.; Potassæ  
 Carbon. ʒ ij.; Vini Alb. Hispan. ℞ ij. Macera per  
 dies xij., et cola. In dos. ʒ ij.—ʒ j. (In Pyrosis,  
 Dyspepsia, &c.)

Form. 779. VINUM ALOES ET SODÆ COMPOSITUM.  
 ℞ Sodæ Carbonatis ʒ ij.; Ammoniac Sesquicarbonatis  
 ʒ iiss.; Myrrhæ ʒ vj.; Aloës Extracti ʒ vj.; Vini  
 Albi (Sherry, Anglicè), ʒ xxiv. Macera per dies  
 septem, et cola. (The dose is from one fluid drachm  
 to half a fluid ounce.)

Form. 780. VINUM ANTRELMINTICUM.  
 ℞ Extr. Aloës, Assafœtidæ, Radicis Gentianæ, Cam-  
 phoræ, Corticis Aurantii sic. Castorei, aa ʒ j.; Croci  
 Stig. ʒ j.; Spirit. Vini Ten. ℞ ij.; Vini Oporto ℞ ij.;  
 Macera lenti calore, et post horas xij. cola. Capiat  
 ʒ ij.—ʒ ij. in Decocto Anthemid., &c.

Form. 781. VINUM DIURETICUM ANTI-ÆTHRITICUM.  
 ℞ Potassæ Carbon., ʒ iiss.; Pulv. Rhei, Juniperi Baccar.  
 cont., aa ʒ jss.; Rad. Zedoarii concis. et contus. ʒ ij.;  
 Canelle in pulv. ʒ ij.; Scillæ Rad. exsic. ʒ j.; Vini  
 Xeræ ʒ xxxij. Macera benè, et cola. Capiat ʒ j.—ʒ ij.  
 bis terve quotidie.

Form. 782. VINUM FERRI CITRATUM. (Phar. Wirtem.)  
 ℞ Ferri Limaturæ ʒ iv. Aurantiorum Amar. No. iv.  
 Excorticatis Aurantilis, cortices et succulenta caro  
 fructuum cum Limaturæ Ferri in pastam redigantur  
 mortario in lapideis. Dies post tres infunde Vini  
 Madefrensis ʒ xij.; Tincturæ Aurantii ʒ ij. Macera  
 per diem integrum, et cola. Dosis, ʒ ss.—ʒ jss.

Form. 783. VINI FERRI COMP.  
 ℞ Ferri Sesquioxidi ʒ j., vel Ferri Fragmentor. ʒ ij.;  
 Radicis Calami Arom. ʒ ij. Infunde Vini Albi His-  
 panicæ ℞ ij., et stent in digestionem per dies 6—8.  
 Exinde sumantur quotidie uncia una vel duæ, et sup-  
 pleantur vinum.

Form. 784. VINUM QUINÆ.  
 ℞ Vini Madefrensis ʒ viij.; Quinæ Sulphatis gr. xvj.  
 M.

## ADDENDA TO APPENDIX OF FORMULÆ.

Form. 785. BALSAMUM ODONTALGICUM.  
 ℞ Opli Puri, Camphoræ rasæ, aa ʒ j.; solve in Spirit.  
 Rect. Terebinth. ʒ jss.; Olei Caryoph. et Ol. Ca-  
 juputi aa ʒ ss.; Balsam. Peruvian. ʒ ij. Misce benè.

Form. 786. BOLUS CAMPHORÆ COMPOSITUS.  
 ℞ Camphoræ gr. v.—xv.; Hydrarg. Chlorid. gr. v.—xx.;  
 Opli Puri gr. j.—ij.; Conserv. Rosarum q. s. ut fiat  
 Bolus.

Form. 787. BOLUS CAMPHORÆ ET HYOSCYAMI.  
 ℞ Camphoræ subactæ gr. v.—xj.; Extract. Hyoscyami  
 gr. v.—x.; Potassæ Nitratis gr. v.—vij.; Conserv.  
 Rosar. q. s. M. Fiat Bolus, horâ somni sumendus.  
 (In Puerperal Mania, and in Mania after Evacuations,  
 to be accompanied with cold sponging the head.)

Form. 788. BOLUS CATECHU.  
 ℞ Catechu Extr. gr. viij.—xij.; Confect. Aromat. gr.  
 viij.; Syrup. q. s. M. Fiat Bolus.

Form. 789. BOLUS MOSCHI ET CAMPHORÆ.  
 ℞ Moschl gr. v.—x.; Camphoræ rasæ gr. ij.—vij.;  
 Spirit. Rect. ℞ j.; Confect. Ros. Gall. q. s. Cam-  
 phoram cum Spiritu tere, et deinde, secundum  
 artem, fiat Bolus.

Form. 790. ELECTUARIUM DEOBSTRUENS.  
 ℞ Potassæ Bitart. ʒ j.; Biboratis Sodæ ʒ ij.; Sulphur.  
 Præcipit. ʒ vj.; Confectionis Sennæ ʒ jss.; Syrup.  
 Zingiberis ʒ vj.; Syrup. Papaveris ʒ ij. M. Fiat  
 Electuarium, cujus capiat cochlearia duo minima  
 omni nocte.

## Form. 791. ELECTUARIUM FERRI SESQUIOXIDI.

R Ferri Sesquioxidi, Syrupi Zingiberis,  $\text{aa}$   $\frac{3}{4}$  ss.; Confectionis Aurantiorum  $\frac{3}{4}$  ij. M. Fiat Electuarium, de quo capiatur moles nucis moschate bis vel ter quotidie.

## Form. 792. EMLASTRUM ANTIMONI POTASSIO-TARTARIS.

R Emplast. Picis Comp. quantum velis; super Alutum extende, et Antimon. Pot.-Tart. pulvere leviter inperge. Fiat Emplastrum.

## Form. 793. EMLASTRUM PICIS ET PETROLEI.

R Picis Liquidæ  $\frac{3}{4}$  ij.; Galbani  $\frac{3}{4}$  j.; Sulphuris, Succini,  $\text{aa}$   $\frac{3}{4}$  ij.; Semin. cumini cont., Pulv. Flor. Anthemidis,  $\text{aa}$   $\frac{3}{4}$  jss.; Petrolei  $\frac{3}{4}$  ss. Liquefac Galbanum cum Aceti q. s., idque misce cum Pice liquida; dein adde alia, et misce bene.

## Form. 794. ENEMA COMMUNE.

R Sodii Chloridi  $\frac{5}{4}$  vj.— $\frac{3}{4}$  j.; Decocti Avenæ  $\frac{3}{4}$  x.; Olei Lini  $\frac{3}{4}$  jss.— $\frac{3}{4}$  jss. M. Fiat Enema.

## Form. 795. ENEMA IPECACUANHE.

R Rad. Ipecacuanhæ contritæ  $\frac{3}{4}$  j.; Aquæ Ferventis  $\frac{3}{4}$  x. Macera per horum et fiat Enema.

## Form. 796. FOTUS CONII.

R Conii Folior. exsic.  $\frac{3}{4}$  j. Coque ex Aquæ Olij. ad Oij., et cola.

## Form. 797. GARGARISMA CAPSICI.

R Capsici Baccarum contus. gr. xv.; Aquæ Ferventis  $\frac{3}{4}$  ix. Infunde per horas tres, et cola.

R Liquoris Colati  $\frac{3}{4}$  vijss.; Acidi Hydrochlorici  $\frac{3}{4}$  xxv. ad  $\frac{3}{4}$  xxxv.; Tinct. Myrrhæ  $\frac{3}{4}$  ijss.; Mellis Rosæ  $\frac{3}{4}$  ss. M. Fiat Gargarisma. (The Biboras Sodæ, Extractum Catechu, or any other astringent, may be substituted, according to circumstances, in the place of the Hydrochloric Acid.)

## Form. 798. GARGARISMA CUM SODA CHLORINATA.

R Liquoris Sodæ Chlorinatæ  $\frac{3}{4}$  xij.; Aquæ Destillat.  $\frac{3}{4}$  vj.; Mellis  $\frac{3}{4}$  ss. M. Fiat Gargarisma, sæpe utendum.

## Form. 799. GARGARISMA STIMULANS.

R Infusi Petal. Rosæ Gallicæ  $\frac{3}{4}$  jss.; Acidi Hydrochlor. Diluti  $\frac{3}{4}$  ij.; Tinct. Capsici  $\frac{3}{4}$  jss.; Aquæ  $\frac{3}{4}$  ij. Fiat Gargarisma sæpe utendum.

## Form. 800. GARGARISMA ZINCI SULPHATIS.

R Zinci Sulphatis  $\frac{3}{4}$  j.; Aquæ Rosæ  $\frac{3}{4}$  vj.; Oxymellis Simpl. f.  $\frac{3}{4}$  j. M. Fiat Gargarisma, frequenter utendum.

## Form. 801. GUTTÆ ÆTHEREÆ.

R Camphoræ rassæ  $\frac{3}{4}$  j.; Spiritus Æther. Nit.  $\frac{3}{4}$  ss.; Tinct. Valerianæ  $\frac{3}{4}$  ij.; Aquæ Fontanæ  $\frac{3}{4}$  jss. M. Capiat  $\frac{3}{4}$  ss. ad  $\frac{3}{4}$  ij. pro dosi.

## Form. 802. GUTTÆ ÆTHEREÆ ARSINTHII.

R Olei Absinthii  $\frac{3}{4}$  ss.; Spirit. Ætheris Sulphurici Comp. et Spirit. Vin. Rect.  $\text{aa}$   $\frac{3}{4}$  ij. M. Sumat æger gut. xx.—xxx. omni horâ, aut omni bi aut trihorio.

## Form. 803. GUTTÆ ANTISPASMODICÆ.

R Tinct. Ammon. Comp.  $\frac{3}{4}$  vj.; Æther. Sulphur.  $\frac{3}{4}$  j.; Olei Anthemidis  $\frac{3}{4}$  j.; Tinct. Opii Comp.  $\frac{3}{4}$  ij.; Extr. Papaveris Albi  $\frac{3}{4}$  j. M. Capiat  $\frac{3}{4}$  xx.—xiv. in cyatho Infus. Anthemidis, vel Infus. Flor. Sambuci, vel Decoct. Hordei Comp., &c. (GHUARD.)

## Form. 804. GUTTÆ ODONTALGICÆ.

R Opii Puri et Camphoræ  $\text{aa}$  gr. x. Solve in pauxillo Alcoholis, et adde Olei Caryophyl.  $\frac{3}{4}$  j.; Olei Cajuputi  $\frac{3}{4}$  j. Misce bene. — Vel,

R Camphoræ rassæ  $\frac{3}{4}$  ss.; Tinct. Opii  $\frac{3}{4}$  j.; Creasoti  $\frac{3}{4}$  j. Misce bene.

## Form. 805. HAUSTUS CHLORINÆ.

R Solutionis Chlorinæ  $\frac{3}{4}$  ss.; Aquæ Destillat.  $\frac{3}{4}$  xij.; Syrup. Papaveris Albi  $\frac{3}{4}$  ss. M. Fiat Haustus, ôtis vel ôtis horis sumendus.

## Form. 806. HAUSTUS ARSENICALIS.

R Confectionis Aromaticæ  $\frac{3}{4}$  j.; Aquæ Menthae Sacræ  $\frac{3}{4}$  j.; Tincturæ Opii, Liguoris Potassæ Arsenicæ,  $\text{aa}$   $\frac{3}{4}$  vj. M. Fiat Haustus, ter quotidie sumendus.

## Form. 807. HAUSTUS BALSAMI PERUVIANI.

R Balsami Peruviani  $\frac{3}{4}$  v. ad  $\frac{3}{4}$  j.; Muclilaginis Acaciæ  $\frac{3}{4}$  jss. Tere simul; et adde, Mist. Camphoræ  $\frac{3}{4}$  vj.; Spiritus Anisi  $\frac{3}{4}$  jss.; Aquæ Anethi (vel Aq. Chamam.)  $\frac{3}{4}$  ss. Fiat Haustus, ter quaterve de die capiendus.

## Form. 808. HAUSTUS BELLADONNÆ ET CINCHONÆ.

R Decocti Cinchonæ  $\frac{3}{4}$  xiv.; Extracti Cinchonæ gr. x.; Tincturæ Belladonnæ  $\frac{3}{4}$  xx. (See F. 704.); Tincturæ Aurantiorum  $\frac{3}{4}$  jss. M. Ft. Haustus, ter in die capiendus.

## Form. 809. HAUSTUS DIAPHORETICUS.

R Vinii Ipecacuanhæ, Vinii Antimonii Pot.-Tart.,  $\text{aa}$   $\frac{3}{4}$  ij. x.; Liq. Ammon. Acet.  $\frac{3}{4}$  jss.; Mist. Camphoræ  $\frac{3}{4}$  j.; Tinct. Hyoscyami  $\frac{3}{4}$  xxv.; Spirit. Æther. Nit.  $\frac{3}{4}$  jss.; Syrupi Aurantii  $\frac{3}{4}$  j. M. Fiat Haustus, quartis horâ capiendus.

## Form. 810. HAUSTUS EMMENAGOGUS.

R Decocti Aloës Comp.  $\frac{3}{4}$  j.; Biboratis Sodæ  $\frac{3}{4}$  ss.— $\frac{3}{4}$  j.; Tinct. Aloës Comp.  $\frac{3}{4}$  j.; Tinct. Castorei  $\frac{3}{4}$  j.; Tinct. Croci  $\frac{3}{4}$  ss.; Aquæ Cinnam.  $\frac{3}{4}$  ij. Fiat Haustus, cessi nocte sumendus.

## Form. 811. HAUSTUS HYOSCYAMI ET ANISI.

R Extracti Hyoscyami gr. ij.—v.; Tinct. Scillæ  $\frac{3}{4}$  x.—xij.; Spirit. Anisi  $\frac{3}{4}$  jss.; Aquæ Anisi  $\frac{3}{4}$  jss.; Acidi Nitrici  $\frac{3}{4}$  vij. Fiat Haustus, horis tertius vel quartis durante paroxysmo Dyspnœæ, &c. capiendus.

## Form. 812. HAUSTUS NERVINUS.

R Spirit. Ammon. Feetid., Tinct. Colchici Comp., Spirit. Æther. Nit.,  $\text{aa}$   $\frac{3}{4}$  ss.; Liguor Ammoniacæ Acet.  $\frac{3}{4}$  j.; Mist. Camphoræ  $\frac{3}{4}$  j.; Syrupi Croci  $\frac{3}{4}$  j. M. Fiat Haustus, bis terve in die sumendus.

## Form. 813. HAUSTUS PECTORALIS.

R Balsami Peruviani (vel Bals. Tolutani)  $\frac{3}{4}$  ss.— $\frac{3}{4}$  ij.; Olei Anisi  $\frac{3}{4}$  v.—x.; Extr. Conii gr. ij.—vj.; Mucilag. Gummi Acaciæ  $\frac{3}{4}$  ij.; Aquæ Pimentæ et Aq. Fœniculi  $\text{aa}$   $\frac{3}{4}$  ss. M.

## Form. 814. HAUSTUS QUARINÆ ET FERRI.

R Tincturæ Ferri Sesquichlor.  $\frac{3}{4}$  vj.—xij.; Infus. Quarinæ, Aquæ Cinnam.  $\text{aa}$   $\frac{3}{4}$  vj. Tincturæ Calumbæ  $\frac{3}{4}$  j. M. Fiat Haustus, mane et meridie sumendus.

## Form. 815. HAUSTUS SALINUS.

R Potassæ Carbonatis  $\frac{3}{4}$  j.; Succo Limonium recentis  $\frac{3}{4}$  ss.; Mixture Camphoræ  $\frac{3}{4}$  j.; Potassæ Nitratis gr. x.; Syrupi Rheodæ  $\frac{3}{4}$  j. M. Fiat Haustus, quartis quaque horâ sumendus.

## Form. 816. HAUSTUS SALINUS AROMATICUS.

R Potassæ Carbonatis  $\frac{3}{4}$  j.; Succo Limonium recentis  $\frac{3}{4}$  ss. vel q. s.; Aquæ  $\frac{3}{4}$  j.; Spirit. Myristicæ, Syrupi Aurantii,  $\text{aa}$   $\frac{3}{4}$  j. M.

## Form. 817. HAUSTUS SALINUS DEMULCENS.

R Mist. Amygdal. Dulc., Mist. Camph.,  $\text{aa}$   $\frac{3}{4}$  ss.; Vinii Ipecac.  $\frac{3}{4}$  x.; Potassæ Bicarbonatis gr. xv.; Syrupi Scillæ  $\frac{3}{4}$  j. M. Sumatur cum Succo Limonis coch. uno amplo, in effervescentiæ impetu ipso.

## Form. 818. HAUSTUS SALINUS SEDATIVUS.

R Potassæ Nitratis gr. vj.—xv.; Sodæ Carbon. gr. x.— $\frac{3}{4}$  jss.; Tinct. Hyoscyami  $\frac{3}{4}$  ss. (vel Tinct. Camphoræ Comp. pristib.  $\frac{3}{4}$  j.); Mist. Camphoræ, Aquæ Ment. Virid.,  $\text{aa}$   $\frac{3}{4}$  vj.; Syrup. Croci  $\frac{3}{4}$  ss. M. Fiat Haustus, tertius vel quartis horis sumendus.

## Form. 819. HAUSTUS SEDATIVUS.

R Ammoniacæ Sesquicarbonatis gr. xv.; Aquæ Destillat.  $\frac{3}{4}$  j.; Spirit. Myristicæ  $\frac{3}{4}$  j.; Syrup. Aurantii  $\frac{3}{4}$  ss.; Extr. Conii gr. ij.—vj. Fiat Haustus, ter quaterve quotidie sumendus, cum Succo Limonis recentis cochleari uno magno, in effervescentiæ impetu.

## Form. 820. HAUSTUS SEDATIVUS CUM MAGNESIA.

R Magnesiae Carb.  $\frac{3}{4}$  ss.; Aquæ Ment. Virid.  $\frac{3}{4}$  xj.; Spirit. Anisi  $\frac{3}{4}$  jss.; Olei Caryophyl.  $\frac{3}{4}$  j.; Syrupi Zingib.  $\frac{3}{4}$  ss. M. Fiat Haustus.

## Form. 821. HAUSTUS SEDATIVUS ET REFRIGERANS.

R Potassæ Nitratis gr. x.; Tinct. Opii  $\frac{3}{4}$  vj.; Syrupi Papav. Alb.  $\frac{3}{4}$  j.; Mist. Camphoræ  $\frac{3}{4}$  x. Misce. Fiat Haustus, omni 6<sup>ta</sup> horâ sumendus.

## Form. 822. HAUSTUS TONICUS ALKALINUS.

- R Potassæ Bicarbonatis ʒ j.; Infusi Gentianæ Compos.,  
Aque Pimentæ, ʒā 3 vj.; Tincturæ Rhei ʒ j. M.  
Fiat Haustus, meridie et horā somni sumendus.

## Form. 823. INFUSUM ANGELICÆ SYLVESTRIS.

- R Radicis Angelicæ Sylvest., Calam. Aromatici, ʒā 3 iij.;  
infunde cum Aquæ Font. Ferventis ʒ vj. Stent per  
horam in vase clauso; cola, et adde Liquoris Am-  
moniacæ Acetat. ʒ ss.; Ætheris Sulphur. ʒ jss.;  
Syrupi Cort. Aurantii ʒ iij. M. Fiat Mist. Capiat  
eger quilibet horā cochlearē unum.

## Form. 824. INFUSUM ANISI COMPOSITUM.

- R Seminum Anisi ʒ jss.; Foliorum Melissa Officialis  
ʒ j.; Aquæ Communis Calidæ lb ij. Infunde per  
quadrantem horæ; cola, et adde Sacchari Albi quan-  
tum libet.

## Form. 825. INFUSUM GALLÆ.

- R Gallarum contus. ʒ ij.; Aquæ Ferventis lb j. Macera  
per horas viginti quatuor, et cola.

## Form. 826. INFUSUM SERPENTARIE.

- R Radicis Serpentariæ ʒ iij.; infunde cum Aquæ Fer-  
ventis ʒ viij., ebull. paul. Cola, et adde Æther.  
Sulphur. ʒ ij.; Tinct. Camphoræ Comp. ʒ j. M.  
Capiat aeger quilibet horā cochlearē unum.

## Form. 827. INFUSUM TURIONUM PINI ABLETIS.

- R Turionis Pini Abletis ʒ iij.; infunde Aq. Ferridæ ʒ x.  
per semi-horam; dein exprime, cola, et adde vel Po-  
tassæ Carb., vel Potassæ Sulphatæ, vel Spir. Æther.  
Nit., vel Sp. Junip. Comp., ut sit occasio.

## Form. 828. INJECTIO ASTRINGENS.

- R Quercus Cort. cont. ʒ vj.; Aquæ Destil. ʒ x. Coque  
per partem horæ sextam, et cola.  
R Liquoris Colati ʒ iv.; Infusi Lini ʒ iv.; Extr. Conii  
ʒ jss.; Biboratis Sodæ ʒ j. M.

## Form. 829. LINCTUS CUM IPECACUANHA.

- R Olei Anygdalarum, Syrupi Limonum, sing. ʒ j.;  
Pulveris Ipecacuanhæ gr. vj.; Confectionis Rosæ  
Cantæ ʒ j.; Pulv. Tragacanthæ Comp. ʒ iij. Misc.  
Cochlear minimum subindè deglutatur.

## Form. 830. LINCTUS REFRIGERANS.

- R Pulpæ Tamarindorum, Syrup. Althææ, ʒā ʒ ij.; Po-  
tassæ Bitart. ʒ iijss.; Potassæ Nitratis ʒ jss. M.  
Sumat omni trithorio duo cochlearia parva.

## Form. 831. LINCTUS TEREBINTHINÆ.

- R Olei Terebinth. ʒ ij.—ʒ j.; Mellis Despumatæ ʒ j.—  
ʒ iijss.; Pulv. Radicis Glycyrrh. q. s. ut fiat Linctus,  
de quo sumatur cochlearē parvum vel medium, nocte,  
mane meridieque.

## Form. 832. LINIMENTUM OPIATUM.

- R Tinct. Opil Comp. ʒ ss.; Camphoræ ʒ ij.; Olei  
Amygdal. Dulc. ʒ ij. M. Sit Linimentum.

## Form. 833. LOTIO ACIDI HYDROCYANICI.

- R Acidi Hydrocyanici ʒ ij.; Plumbi Acetatis, gr. xvj.;  
Aquæ Destil. ʒ viijss.; Spirit. Vin. Rect. ʒ ij. Fiat  
Lotio, parti affectæ applicanda. (Thompson, in  
Cutaneous Eruptions.)

## Form. 834. LOTIO ACIDI NITRO-HYDROCHLORICI.

- R Acidi Nitro-Hydrochlor. Diluti (F. 5.) ʒ ij.—ʒ ss.;  
Aquæ Calidæ ʒ xvj. M. Fiat Lotio, quamprimum  
preparata sit, ope spongiæ, utenda.

## Form. 835. MISTURA ALKALINA ANODYNA.

- R Sodæ Sesquicarbonatis ʒ j. (vel Potassæ Bicar-  
b. gr. xvj.); Misturæ Amygdalarum ʒ jss.; Tinct.  
Hyoscyami lb xx.—ʒ ss.; Tincturæ Cardam. Comp.  
ʒ ss. Fiat Haustus, bis vel ter die sumendus.

## Form. 836. MISTURA AMMONIACI ET CONII.

- R Acidi Nitrici ʒ j.; Aquæ Pulegii ʒ iv. Misce; dein  
tere cum Ammoniaco ʒ j., et adde Extr. Conii ʒ ss.;  
Syrupi Tolutani ʒ ss. M. Capiat coch. unum in  
Decocto Althææ, &c.

## Form. 837. MISTURA ANODYNA.

- R Aquæ Ment. Virid. ʒ viijss.; Potassæ Nitratis ʒ ij.;  
Spir. Ætheris Nit. ʒ ij.; Tinct. Hyoscyami ʒ jss.;  
Succi Insipiatii Samb. Nig. ʒ jss.; Extracti Tara-  
xaci, Syrupi Aurantii, ʒā ʒ ij. M. Fiat Mist. cuius  
capiat cochlearia duo larga, ter quotidie.

## Form. 838. MISTURA ANTE CARDIACIAM.

- R Magnesie ʒ j.; Aquæ Anethi ʒ ivss.; Potassæ Ni-  
tratis ʒ jss.; Liqueur. Potassæ ʒ j.; Tinct. Calumbæ  
ʒ ij.; Spirit. Carul et Spirit. Anisi ʒā ʒ iijss.; Tinct.  
Lavand. Comp. ʒ j.; Syrupi Zingiberis ʒ ij. Misce.  
Capiat cochlearē unum amplum subinde in cyatho  
Decoct. Hordei Comp., prius agitatā phialâ.

## Form. 839. MISTURA ANTI-DYSENTERICA. (1.)

- R Æther. Sulphurici ʒ ij.; Tinct. Opil Comp. ʒ iij.;  
Sacchari Alb. ʒ ss.; Gum. Acaciæ ʒ iijss.; Olei  
Anthemidis lb xv.; Extr. Humuli ʒ jss.; Extr.  
Catechu ʒ j.; Pulv. Canellæ Cort. ʒ j.; Aquæ  
Menth. Virid. ʒ viijss. Misce benè. Capiat cochlearia  
duo, tertis vel quartis horis.

## Form. 840. MISTURA ANTI-DYSENTERICA. (2.)

- R Mist. Camphoræ ʒ v.; Liq. Ammon. Acet. ʒ ij.;  
Spir. Æther. Nit. ʒ iijss.; Vinl Ipecacuanhæ ʒ iijss.;  
Tinct. Humuli ʒ iijss.; Extr. Humuli ʒ j.; Syrupi  
Papaveris ʒ iij. M. Fiat Mist., cuius capiât coch-  
learia duo larga, tertâ quaque horâ.

## Form. 841. MISTURA ANTI-ICTERICA.

- R Potassæ Acetat., Extracti Taraxaci, ʒā ʒ ss.; Extr.  
Conii gr. x.—xx.; Aquæ Foeniculi ʒ viijss.; Syrupi  
Sarzæ et Syrupi Sennæ ʒā ʒ ss. M. Capiat cochlear.  
ij. vel iij. ampla, 4tis horis.

## Form. 842. MISTURA ASSAFETIDÆ ET CONII.

- R Assafetidæ ʒ ij.; solve in Liqueur. Ammoniacæ Acet.  
ʒ jss.; Aquæ Foeniculi ʒ iijss.; Extr. Conii ʒ j.—  
ʒ ss.; Syrupi Senegæ ʒ ss. Misce.

## Form. 843. MISTURA BALSAMI PERUVIANI COMP.

- R Balsami Peruviani Ver. ʒ ij.; Mellis Despumatæ ʒ vj.  
Misce, et adde gradatim, Misturæ Myrrhæ (F. 422.)  
ʒ vj.; Tincturæ Aurantii ʒ j. M. Fiat Mistura,  
cuius capiât coch. j. ad iij. ter quaterve in die.

## Form. 844. MISTURA BELLADONNÆ.

- R Extracti Fol. Belladonnæ gr. ij. ad iv.; Moschi Optimi  
gr. vj. ad xij.; Sacchari Albi, satis quantum ut te-  
rendo obtineatur pulvis congener; deinde adde,  
paulatim miscendo, Infusi Frigidæ Rad. Valerianæ  
ʒ iv.; Spirit. Æther. Sulphur. Comp. ʒ j.; Syrupi  
Papaveris ʒ iij. M. Capiat aeger cochlear. ij. vel  
iij. larga, 3tis, 5tis, vel 6tis horis.

## Form. 845. MISTURA CAMPHORÆ AMMONIATA.

- R Camphoræ ʒ j.; Alcoholis lb vj.; tere, et adde  
Moschi ʒ ss.; tere cum Sacchar. Albi ʒ j.; Mist.  
Amygdal. Dulc. ʒ iv.; Spirit. Ammon. Arom. ʒ ij.;  
Syrupi Aurantii ʒ ss. M. Capiat ʒ ss.—ʒ j. 4tis horis.

## Form. 846. MISTURA CARDIACA.

- R Potassæ Bicarbonatis ʒ jss.; Misturæ Camphoræ  
ʒ vas.; Confectionis Aromaticæ ʒ ij.; Spiritus Myr-  
rysticæ ʒ ss. M. Fiat Mistura, cuius sumantur  
cochlearia tria ampla cum cochleari uno Succi Limon-  
um recentis, in actu effervescentis.

## Form. 847. MISTURA CHLORATIS POTASSÆ ET SODÆ.

- R Liq. Sodæ Chlorinat. ʒ ss.; Aquæ Destil. ʒ iv.; Po-  
tassæ Chloratis ʒ j.; Aquæ Pimentæ ʒ iijss. M. Ca-  
piat coch. j.—iij. 2dis, 3tis, vel 4tis horâ.

## Form. 848. MISTURA CINCHONÆ CUM ACIDO.

- R Infusi Cinchonæ ʒ viij.; Acidi Hydrochlorici Diluti  
ʒ j.; Tinct. Capsici ʒ ss.; Tinct. Croci vel Serpen-  
tariæ ʒ ij.; Syrupi Papaveris ʒ iijss. M. Fiat Mist.,  
cuius capiât coch. ij. vel iij. ampla, 4ta q. q. horâ.

## Form. 849. MISTURÆ CINCHONÆ ET ACIDI SULPH.

- R Decocti Cinchonæ ʒ vas.; Acidi Sulphur. Aromat.  
ʒ j.; Tinct. Opil lb xxx. M. Capiat tertiam partem  
ter quotidie.

## FORM. 850. MISTURA COPAIBÆ.

R. Copaiabæ Ver. 5 ℥j.; Mucilaginis Acaciæ Ver. 3 jss. Misce. Adde gradatim, Aquæ Cinnamon 3 ℥ss.; Sodæ Carbonatæ 5 j.; Tinct. Lavandulæ Compositæ 3 ℥j.; Tincturæ Opil 5 j. ad 3 jss. Misce. Fiat Mistura, cujus capiat unc. j. ter quaterve in die, agitata phalâ.

## FORM. 851. MISTURA CYDONIÆ INFUSI COMP.

R. Seminum Cydoniæ contus. 5 ℥j.; Radicis Glycyrrhizæ contus. 3 j.; Flicî Caricæ Fructus 3 j.; Aquæ Oj. Coque leni igne per partem horæ sextam; dein cola. R. Hujus Decocti 3 vjss.; Potassæ Bitart. 5 ℥j.; Biboratis Sodæ 3 j.; Spirit. Æther. Nit. 5 ℥j.; Syrupi Mori vel Syr. Limonis 3 ss. M. Fiat Mist.

## FORM. 852. MISTURA DECOCTI CINCHONÆ.

R. Decocti Cinchonæ 3 vjss.; Tinct. Cinchonæ 3 ℥j.; Confect. Arom. 9 jss.; Spirit. Ammon. Arom. 3 jss. M.

## FORM. 853. MISTURA DECOCTI GENIÆ.

R. Scoparii Cacaum. 3 j.; Aquæ Oj.; coque ad 5 vjll., et adde Acetatis Potassæ 3 jss.; Spirit. Junip. Comp. 5 vj. M. Capiat coch. ℥j. vel ℥j. larga, ter quotidè.

## FORM. 854. MISTURA DIAPHORETICA.

R. Vini Ipecacuanhæ 5 jss.; Spirit. Æther. Nit. 5 jss.; Liq. Ammon. Acet. 3 ℥j.; Liq. Antimon. Pot.-Tart. 5 jss.; Mist. Camphoræ 3 vjss.; Syrupi Papaveris 3 ℥j. M. Capiat cochlear. j. vel ℥j. tertiâ quaque horâ.

## FORM. 855. MISTURA DIAPHORETICA ANODYNA.

R. Mist. Superscript. (F. 854.) 3 vjss.; Tinct. Hyoscyami 3 jss. (vel Tinct. Camphoræ Comp. 3 vj.), vel Extr. Conii 3 ss.) Fiat Mist.

## FORM. 856. MISTURA CUM DIGITALE ET KERM. MINER.

R. Kermis Mineral. gr. vj.; Mucilag. Acaciæ 3 ℥j.; Infusi Digitalis 3 ℥v.; Syrupi Althææ 3 j. M. Capiat cochleare unum amp. omni bishorio. (In Pneumonia, Pleurisy, &c. by BRERA.)

## FORM. 857. MISTURA EXPECTORANS.

R. Assafetidæ 9 jss.; trituratione solve in Aquæ Menthæ Virid. 3 ℥ss.; et adde Vini Ipecacuanhæ 5 j.; Spirit. Æther. Nit. 3 ℥j.; Tinct. Castorei 5 ℥j.; Syrupi Tolutani 3 j. Fiat Mist., cujus capiat cochleare unum amplum, 2dis vel 3dis horis.

## FORM. 858. MISTURA CUM POTASSII IODID ET ACIDO HYDROCYANICO.

R. Aquæ Destill. 5 ℥ss.; Solutionis Potassii Iodidi ℥ xv.; Acidii Hydrocyanici Medicin. ℥ x.—xij.; Extracti Lactucæ gr. xij.; Syrupi Althææ 3 j. M. Capiat 5 ℥j.—5 ℥j. omni horâ, vel 3 ss. omni bishorio.

## FORM. 859. MISTURA CONTRA HYDROPEM.

R. Fol. Digitalis 3 j.; Corticis Cinchonæ Pulv. 5 vj.; Aquæ Ferrentis 3 ℥j. Macera per horam, et cola. Liquori Colato adde Potassæ Bitart. 3 ℥j.; Biboratis Sodæ 5 j.; Tinct. Cinnam. Co., Spirit. Junip. Co., ad 5 ℥j.; Tinct. Opil Co. ℥xxv. M. Capiat cochlearia duo larga, ter quaterve quotidè. (Nearly as AUGUSTIN.)

## FORM. 860. MISTURA INFUSI ANTHEMIDIS COMP.

R. Flor. Anthemidis 5 ℥j.; Pulv. Rad. Valerian. 5 ℥j.; Infunde Aquæ Fontanæ Calidæ 3 ℥j. Macera paulliper, et cola.

R. Hujus Infusi 3 vj.; Tinct. Camphoræ Comp., Tinct. Castorei, ad 3 ℥j.; Syrupi Aurantii 3 ss. M. Capiat æger quâlibet horâ cochleare plenum.

## FORM. 861. MISTURA INFUSI CALUMBÆ ET HYOSCYAMI.

R. Infusi Calumbæ 3 vjss.; Tinct. Hyoscyami 3 ℥j.; Sodæ Carbon. 3 jss.; Tinct. Aurant. Comp. 3 jss.; M. 3 ss. ter quaterve in die. (In Diseases of Irritability.)

## FORM. 862. MISTURA INFUSI CALUMBÆ COMP.

R. Infusi Calumbæ 3 ℥v.; Aquæ Menthæ Piper. vel Aquæ Anethi 3 ℥j.; Spirit. Anisi 5 ℥j.; Liquoris Ammoniac vel Liqnor. Potassæ 3 ℥j.; Syrupi Cort. Aurantii 3 ss. M.

## FORM. 863. MISTURA INFUSI VALERIANÆ.

R. Infusi Valerianæ 3 vjss.; Liq. Ammoniac Acet. 3 jss.; Liq. Antimonii Pot.-Tart. 3 jss.; Tinct. Hyoscyami 3 jss.; Aq. Pimentæ 3 ss. M. Fiat Mist., cujus capiat æger alterâ quaque horâ cochlearia duo.

## FORM. 864. MISTURA HYDROCHLOR. AMMONIÆ.

R. Ammoniac Hydrochlor. 3 jss.; Acidi Hydrochlor. 3 ss.; Decocti Hordei Comp. ℥ j. M. Capiat cochlear. ℥j. ampla, 2dis vel 3dis horis.

## FORM. 865. MISTURA SALINÆ SEDATIVA.

R. Potassæ Nitratis, 5 ss.—5 ℥j.; Sodæ Carbon. 3 j.—5 jss.; Mist. Camphoræ, Aquæ Menth. Virid., ad 3 ℥jss.; Extr. Humuli 3 ℥j.; Syrupi Zingiberis 3 ℥j. M. Fiat Mist. (Interdum adde Tinct. Hyoscyami, vel Tinct. Camphoræ Co.)

## FORM. 866. MISTURA SEDATIVA.

R. Mucilaginis Acaciæ 3 j.; Olei Amygdalarum, Syrupi Papaveris Albi, ad 3 ss.; Tinct. Hyoscyami 5 jss.; Vini Ipecacuanhæ 3 ℥j.; Aquæ Destillatæ 3 vjss.; Acidi Citrici q. s. ad gratam acidulationem. Misce. Fiat Mist., cujus sumat coch. unum medium subitè.

## FORM. 867. MISTURA CUM SODÆ BICARBONATE.

R. Mist. Camphoræ, Aq. Anethi, ad 3 ℥ss.; Biboratis Sodæ 3 ℥j.; Vini Ipecacuanhæ 5 jss.; Syrupi Papaveris 3 jss. M. Fiat Mist., cujus capiat cochlearia ℥j. vel ℥j. quartis horis.

## FORM. 868. MISTURA CUM SODÆ POTASSIO-TARTRAT.

R. Sodæ Potassio-Tartrat. pulver. 3 vj.; Mistura Amygdalæ 3 ss.; Spiritus Myristicæ 3 ss. M. Sumat tertiam partem, secundâ quaque horâ.

## FORM. 869. MISTURA STOMACHICA. (1.)

R. Calumbæ Radicis contusæ 5 ss.; Calami Aromatiz. cont. 3 j.; Capsici Anni Bac. cont. gr. x.; Aquæ Ferrentis 3 ℥j. Macera per horas duas; deinde cola.

R. Liquoris Colati 3 vjss.; Liquoris Potassæ Carbon. 5 ℥ss.; Tinct. Myrrhæ 5 j.; Extracti Conii gr. xv.; Syrupi Cort. Aurantii 3 ℥j. M.

## FORM. 870. MISTURA STOMACHICA. (2.)

R. Infusi Cascariillæ 3 vj.; Sodæ Carbon. 3 ℥ss.; Tinct. Calumbæ 3 ss.; Æther. Sulphur. 5 ℥j.; Tinct. Aurantii Co. 5 ℥j. M. Fiat Mist., cujus capiat cochlear. ℥j. larga, bis quotidè.

## FORM. 871. MISTURA CONTRA TENEBRUM.

R. Mist. Camphoræ 3 vj.; Liq. Ammon. Acet. 3 ℥j.; Vini Ipecacuanhæ 5 ℥j.; Tinct. Humuli 5 jss.; Tinct. Camphoræ Com. 3 ss.; Extr. Humuli 5 ss.; Syrupi Papaveris 5 ℥j. M. Fiat Mist., cujus capiat cochlearia duo larga, tertiâ quaque horâ.

## FORM. 872. MISTURA TONICO-APERIENS.

R. Decocti Cinchonæ, Infus. Sennæ, ad 3 ℥ss.; Potassæ Sulphatis 5 ℥ss.; Tinct. Sennæ 3 ss. M. Fiat Mist., cujus capiat cochlear. ℥j. larga, bis quotidè.

## FORM. 873. MISTURA TONICO-DEOBSTRUENS.

R. Extr. Taraxaci 5 ℥j.; Extr. Gentianæ 5 j.; Sodæ Carbon. 3 j.; Aquæ Aurantii 5 ℥j.; Spirit. Æther. Sulph. Co., Syrupi Rosæ, ad 3 ss. M. Capiat 3 j.—3 jss., ter die.

## FORM. 874. MISTURA ZINCI COMPOSITA.

R. Zinci Sulphatis gr. iv. ad vj.; Infus. Rosæ Comp. 3 vj.; Vini Ipecacuanhæ 5 jss.; Extr. Lactucæ 9 jss.; Syrupi Tolutani 5 ℥j. M. Fiat Mist., cujus capiat cochleare unum vel duo larga, tertiâ vel quarta horis.

## FORM. 875. MISTURA ZINCI OPLATA.

R. Aq. Rosæ, Aquæ Cinnamon., ad 3 ℥ss.; Zinci Sulphatis gr. viij.; Tinct. Opil ℥ xxxvj.; Tinct. Cinnamon. Co. 3 ℥j.; Syrupi Aurantii 5 jss. M. Fiat Mist., cujus capiat cochlearia ℥j. ampla, bis die.

## FORM. 876. PILULÆ ALKALINÆ ANODYNÆ.

R. Sodæ Carbon. exsic. 3 j.; Saponis Duri 3 j.; Extracti Hyoscyami 5 ss.; Olei Junip. q. s. M. Fiat Pilulæ xl., quarum capiat binas vel tres cum lacte. (For Nephritic and Calculous Affections.)

## FORM. 877. PILULÆ ALGÆ CUM FERRO COMPOSITÆ.

R. Aloës 5 ℥j.; Assafetidæ et Myrrhæ, ad 3 ss.; Ferri Sulphatis 5 j.; Caryophyllorum in pulv. 3 j.; Pulv. Capsici gr. xxvj.; Bals. Canad. q. s. M. Fiat Pilulæ lxxvj., quarum capiat binas vel tres pro duse. (In Chlorosis, &c.)

## FORM. 878. PILULÆ ANODYNÆ.

R. Pulv. Jacobi Verr. gr. ℥j.; Extr. Stramonii gr. ss.; Extr. Hyoscyami (vel Conii) gr. ℥j. Fiat Pilulæ ℥j. horâ somni sumende. (In painful Cutaneous Eruptions.)

## Form. 879. PILULÆ ANODYNO-ALTERNATIVÆ.

R Camphoræ rasæ gr. vj.; Hydrarg. cum Creta gr. xij.; Sodæ Carbon. exsic. gr. x.; Pulv. Acaciæ gr. lv.; Extr. Hyoscyami gr. xv.; Syr. Simp. q. s. M. Fiat Pilulæ xij., quarum capiat tres statim, et horâ somni.

## Form. 880. PILULÆ APERIENTES.

R Pulv. Radicis Rhei ʒ ss.; Extracti Aloës Aquosi gr. xvij.; Saponis Medicati ʒ ss.; Syrupi Simp. q. s. M. Fiat Pilulæ xx., quarum sumantur binæ vel tres, bis in die.

## Form. 881. PILULÆ APERIENTES CUM HYOSCYAMO.

R Extracti Gentianæ ʒ ss.; Extracti Colocyth. Comp. ʒ iiss.; Pulv. Ipecacuanhæ gr. viij.; Pilul. Hydrarg. ʒ j.; Extr. Hyoscyami ʒ ij.; Saponis Castil. gr. xij. M. Fiat massa aequalis, et divide in Pilulas xxxvj., quarum capiat binas vel tres horâ somni.

## Form. 882. PILULÆ ASTRINGENTES.

R Aluminis contriti gr. v.; Myristicæ Nucl. contr. gr. lv.; Extr. Gentianæ q. s. (vel adde etiam Opil. Puri gr. j.) Fiat Pilulæ duæ pro dose.

## Form. 883. PILULÆ BELLADONNÆ EXTRACTI ET CINCHONÆ.

R Extracti Belladonnæ gr. j. ad ij.; Extracti Cinchonæ ʒ j. M. Fiat Pilulæ viij. Capiat ij. 6tis horis.

## Form. 884. PILULÆ CAMBOGIÆ, ALOËS, ET AMMONIACI.

R Cambogiæ, Aloës, et Ammoniaci, in pulvere, partes æquales: solve in Aceto; dein liquorem cola, et consume donec crassitudinem idoneam habeat. Divide in Pilulas gr. lv. Capiat binas ad quatuor pro dose. (Diuretice, Purgative.)

## Form. 885. PILULÆ CAMPHORÆ ET AMMONIACI.

R Massæ Pilulæ Aloës cum Myrrha ʒ j.; Gummi Ammoniaci ʒ j.; Camphoræ gr. x.; Syrupi Simplicis q. s. Misce. Fiat Pilulæ xx. Omni mane capiat tres vel quatuor. (STOLL.)

## Form. 886. PILULÆ CAMPHORÆ ET OPIL.

R Camphoræ, Potassæ Nitratis, ʒā ʒ ij.; Saponis Hispan. ʒ ss.; Extr. Opil. Aquos. ʒ ss.; Syrup. Tolutan. q. s. M. Fiat Pilulæ cxx., quarum binas vel tres ter quotidie capiat. (CADET DE GASSICOURT.)

## Form. 887. PILULÆ CAMPHORÆ ET QUININÆ.

R Camphoræ rasæ ʒ j.; Quinæ Sulphatis ʒ ij.; Massæ Pilul. Aloës cum Myrrha ʒ iiss.; Syrupi Zingiberis q. s. M. Fiat massa aequalis, et divide in Pilulas xxxvij., quarum capiat unam bis quotidie.

## Form. 888. PILULÆ CHALYBEATÆ.

R Ferrî Sesquioxidi ʒ ss.; Pulv. (Canelle Albæ ʒ ij.); Aloës Socot. ʒ iiss.; Syrupi Croci q. s. M. Fiat massa aequalis.

## Form. 889. PILULÆ COLOCYNTHIDIS CUM SULPHURE.

R Extr. Colocyth. Comp. ʒ j.; Sulphur. Sublimati ʒ j.; Potassæ Sulphatis ʒ iv.; Syrupi q. s. Divide in Pilulas L.

## Form. 890. PILULÆ COLOCYNTHIDIS EXTR. ET HYOSCYAMI.

R Extracti Colocyth. Compos. ʒ ij.; Extr. Hyoscyami ʒ j. Misce. et divide in Pilulas xij. Sumat unam vel duas pro re natâ.

## Form. 891. PILULÆ DEOBSTRUENTES. (1.)

R Saponis Venet. ʒ j.; Pilul. Hydrarg. gr. viij.—xij.; Gummi Ammon. ʒ ss.; Massæ Pilul. Aloës cum Myrrha ʒ j.; Terebinth. q. s. M. Fiat Pilulæ xxx. Capiat tres vel quatuor de die.

## Form. 892. PILULÆ DEOBSTRUENTES. (2.)

R Pulv. Gummi Guaiaci ʒ j.; Pulv. Gummi Ammoniaci ʒ j.; Ammoniaci Sesquicarbonatis gr. xv.; Massæ Pilulæ Aloës cum Myrrha ʒ iiss.; Tinct. Aloës Comp. q. s. M. Divide in Pilulas xl.; ẽ quibus sumantur tres ter in die cum vasculo Infusi Anthemidis. (Altered from STOLL.)

## Form. 893. PILULÆ DIURETICÆ ET ANTISPASM.

R Pulv. Fol. Digitalis, Pulv. Rad. Scille, ʒā gr. xij.; Extr. Hyoscyami ʒ j. Divide in Pilulas xj. Capiat binas tertis horis. (BERRA.)

## Form. 894. PILULÆ DIURETICÆ CUM HYDRARGYRO.

R Gummi Ammoniaci, Extracti Taraxaci, Saponis Venet. ʒā ʒ j.; Pulveris Scille gr. vj.; Pilulæ Hydrargyri gr. xv.; Olei Junip. q. s. M. Fiat Pilulæ xvij.

## Form. 895. PILULÆ EXPECTORANTES.

R Pulveris Scille ʒ j.; Ammoniaci Gum. Res. ʒ iiss.; Extract. Conil ʒ ij. Contunde simul, et divide massam in Pilulas æquales tringinta; quarum sumat duas sextis horis. (In Asthma and Chronic Catarrh.)

## Form. 896. PILULÆ GENTIANÆ ET ALOËS.

R Aloës Ext. Purif. Gentianæ Extr. ʒā ʒ j.; Saponis Castil. ʒ iiss. M. Divide in Pilulas xxxvj. Capiat unam ad tres pro re natâ.

## Form. 897. PILULÆ GUAIACI ET ACONITI.

R Ext. Aconiti gr. j.; Pulv. Guaiaci gr. viij.; Olei Cajuputi q. s. ut fiant Pil. ij. Capiat unam mane nocteque.

## Form. 898. PILULÆ HUMULI COMP.

R Ammon. Sesquicarb. gr. vj.; Extr. Rhei gr. viij.; Extr. Humuli gr. xij. M. Fiat Pilulæ vj., quarum capiat tres horâ somni.

## Form. 899. PILULÆ HYDRARGYRI COMPOSITE.

R Pilul. Hyd. Chlorid. Comp. ʒ ss.; Pulv. Jacobi Veli gr. xij.; Extracti Conil gr. xij.; Saponis Castil. gr. vj. Contunde simul, et divide massam in Pilulas xij. æquales, quarum binas omni nocte sumantur.

## Form. 900. PILULÆ IPECACUANHÆ COMP.

R Pulv. Ipecacuanhæ gr. vj.; Pulv. Ipecacuan. Comp. Extr. Papaveris, ʒā ʒ j.; Extr. Humuli ʒ ss.; Olei Anisi q. s. M. Fiat Pilulæ xlv., quarum capiat unam quartis horis, vel binas aut tres horâ somni.

## Form. 901. PILULÆ MORPHIÆ ET FERRI SULPHATIS.

R Sulphatis Morphicæ gr. ij.; Olei Amygdal. q. s.; ad solut. dein adde Ferrî Sulphatis gr. vj.; Pulv. Glycyrr. gr. viij.; Mellis q. s. ut fiant Pilulæ viij. Capiat unam tertâ quaque horâ.

## Form. 902. PILULÆ MORPHIÆ HYDROCHLORATIS.

R Hydrochloratis Morphicæ gr. j.; Pulv. Ipecacuanhæ gr. ij.; Extr. Aconiti gr. vj.; Olei Amygdal. Dul. ʒ vj.; Pulv. Glycyrr. et Mellis ʒā q. s. ut fiant Pilulæ viij. Capiat unam ʒtis vel 4tis horis.

## Form. 903. PILULÆ MOSCHI COMPOSITÆ.

R Moschi, Potassæ Nitratis, ʒā gr. vj.; Camphoræ rasæ gr. vj.; Conservæ Ros. q. s. Fiat Pilulæ vj.

## Form. 904. PILULÆ CALCII CHLORIDI ET CONII.

R Calcii Chloridi gr. ij.; Extr. Conil gr. ij.—v. Fiat Pilulæ duæ, bis in die sumende. (In Scrofulous Obstructions.)

## Form. 905. PILULÆ NERVINE. (1.)

R Assafetidæ ʒ ss.; Castorei gr. vj.; Extr. Hyoscyami gr. x.; Extr. Anthemidis ʒ j.; Syrupi Papaveris q. s. M. Fiat Pilulæ xij. Capiat ʒra duas mane nocteque.

## Form. 906. PILULÆ NERVINE. (2.)

R Assafetidæ ʒ ij.; Camphoræ Subactæ gr. xvj.; Moschi gr. vj.; Mucilag. Acaciæ q. s. M. Fiat Pilulæ xvj., ẽ quibus sumatur una omni bithoro.

## Form. 907. PILULÆ NUCIS VOMICÆ ET ALOËS.

R Pilul. Aloës cum Myrrha ʒ iv.; Extracti Nucis Vomicæ gr. x. M. Fiat Pilulæ xxxvj., quarum capiat unam ad duas, mane nocteque.

## Form. 908. PILULÆ SARZÆ COMPOSITE.

R Massæ Pilul. Hydrarg. gr. viij.; Extr. Taraxaci, Extr. Sarzæ, ʒā ʒ v. M. Fiat Pilulæ xlviij., quarum capiat tres quater in die.

## Form. 909. PILULÆ SCILLE ET GALBANI COMP.

R Pilul. Galbani Comp. ʒ j.; Pilul. Scille Comp. ʒ ij.; Ol. Juniperi ʒ v. M. Divide in Pilul. xxiv., quarum sumat binas ter quotidie.

## Form. 910. PILULÆ SODÆ CUM RHEO ET HYOSCYAMO.

R Sodæ Carbon. exsic. ʒ iiss.; Pulv. Rhei ʒ j.; Extr. Hyoscyami ʒ ij. M. Divide in Pilulas xxxvj., quarum, ter quotidie, binæ sumantur.

## Form. 911. PILULÆ STOMACHICÆ.

R Pulveris Rhei, Pulveris Zingiberis, ʒā ʒ ss.; Extracti Anthemidis ʒ j.; Olei Anisi q. s. Fiat massa, in Pilulas æquales tringinta dividenda, quarum capiat tres antè prandium quotidie. (In Dyspepsia and Chlorosis, &c.)

## Form. 912. PILULE SESQUISULPHURETI ANTIMONII.

R Antimonii Sesquisulphuret. Crud., Extract. Dulcimaræ, partes æquales. Sint Pilulæ gr. ij. Capiat ij. vel. iv. ter die.

## Form. 913. PILULÆ TREBIAICÆ COMPOSITÆ.

R Gummi Ammoniaci ʒj.; Camphoræ ʒss.; Moschi Musc. gr. xx.; Pulv. Opii gr. x.; Bals. Peruvian q. s. M. Fiant Pil. gr. ij. Sumat æger unam horâ undecimâ, iterum vespere horâ quintâ; et cubitum petens sumat tres.

## Form. 914. PILULÆ TONICÆ.

R Extracti Gentianæ, Pulv. Rhei, ʒā ʒss.; Saponis Castil. ʒj. M. Fiant Pilulæ xvij., quarum sumatur binæ ter quotidie.

## Form. 915. POTUS APERIENS.

R Mannæ ʒjss.; Potassæ Bitart. ʒss.; Seri Lactis O ij. M. Capiat cyathum pro re natâ.

## Form. 916. POTUS TAMARINDORUM COMP.

R Potassæ Tartratis. Pulp. Tamarind., Gum. Arab., ʒā ʒj. Solve in Aq. Font. Fervid. lb ij. et adde Oxymel. Simp. ʒ ij. M.

## Form. 917. PULVIS AMMONIACO-CAMPHORATUS.

R Ammon. Sesquicarbon. gr. iv.; Camphoræ pulveriz. gr. ij.; Sacch. Albi gr. xxlv. M. pro dose; vel fiant Pil. ij. cum Mucilag. Acaciæ, omissis Saccharo.

## Form. 918. PULVIS ANTI-CATARRHALIS.

R Kermis Mineral. gr. ij.; Florum Sulphuris, Pulv. Rad. Glycyrrh., ʒā gr. xij. Fiat Pulvis, ter die sumendus. (QUARIN and BARTHEZ.)

## Form. 919. PULVIS APERIENS.

R Magnes. Carbon. ʒ ij.; Potassæ Bitart. ʒj.; Pulv. Rhei, Pulv. Rad. Glycyrrh., ʒā gr. vj.—xij. Fiat Pulvis, omni nocte sumendus in theriacâ communi.

## Form. 920. PULVIS CALUMBÆ ET FERRI.

R Ferri Potassio-Tartrat. gr. x.—xv.; Pulv. Calumbæ gr. xij.—ʒj. Fiat Pulvis, ter quotidie capiendus.

## Form. 921. PULVIS CAMPHORÆ ET ANTIMONII.

R Camphoræ rase gr. xvj.; Potassæ Tartratis ʒj.; Antimon. Pot.-Tartrat. gr. j. M. Probe, et in chartulas viij. divide; quarum sumatur una, tertiâ quâque horâ.

## Form. 922. PULVIS DIAPHORETICUS.

R Kermis Mineralis, Camphoræ, ʒā gr. ij.; Gum. Acaciæ, Sacchar. Albi, ʒā gr. viij.; Olei Fœniculi ℥ j. M.

## Form. 923. PULVIS LIENTERICUS.

R Hydrarg. cum Cretâ gr. ij.; Pulv. Ipecacuan. Comp. gr. vj.; Pulv. Rhei gr. v.; Pulv. Cinnamom. gr. vj. M. Fiat Pulvis, bis vel ter die sumendus.

## Form. 924. PULVIS MOSCHI COMPOSITUS.

R Moschi gr. vj.—xij.; Pulv. Rad. Valerian. ʒj.; Camphoræ gr. vj. M. Fiat Pulvis.

## Form. 925. PULVIS MYRRHÆ ET IPECACUANHÆ.

R Pulv. Myrrhæ gr. xvj.; Pulv. Ipecacuan. gr. iv.; Potassæ Nitratis in pulv. ʒ ij.; Pulv. Opii gr. j. Misce benè, et divide in doses æquales quatuor. Capiat unam quartâ quâque horâ.

## Form. 926. PULVIS PRO TORMINIBUS.

R Magnesie, Sacchari Albi, ʒā gr. viij.; Pulv. Canellæ Corticis gr. ij. M. Fiant Pulvis.

## Form. 927. PULVIS RESOLVENS. (STAHLII.)

R Pulv. Antimonii Comp., Potassæ Nitratis, Ocul. Cancror. Præp., ʒā ʒj. tere benè simul. Dosis ʒj.

## Form. 928. PULVIS SAGENTIS.

R Potassæ Chloratis gr. v.—xij.; Sodii Chloridi gr. —xx.; Sodæ Sesquicarbonatis gr. —x.—xv.; Pimentæ, vel Cajuputi, vel Sine, ℥ ij.—v. M. Pulvis pro re natâ sumendus in decocto Hord. jusculo Bovino.

## Form. 929. PULVIS SODÆ NITRATIS COMPOSITÆ.

R Sodæ Nitratis gr. v.—ʒj.; Pulv. CINNAM. gr. Pulv. Ipecacuanhæ gr. ss.—j.; Olei Pimentæ M. Fiat Pulvis, ter quaterve in die sume (For Diarrhœa, Dysentery.)

## Form. 930. PULVIS VALERIANÆ COMPOSITÆ.

R Pulv. Rad. Valerian. ʒj.—ʒ ij.; Magnes. An Hydrochlor., ʒā gr. v.; Olei Cajuputi ℥ ij. M.

## Form. 931. SOLUTIO BELLADONNÆ EXTRACTI.

R Extracti Belladonnæ ʒj.; Aquæ Destillatæ ʒj. Fiat Solutio.

## Form. 932. SOLUTIO CAMBODIÆ ALKALINÆ.

R Gum. Res. Cambodiæ ʒss.; solve in Lâquor. C. Potassæ ʒss. Hujus solutionis capiat ℥ xl. in die, quovis in vehiculo idoneo. (Both Di and Cathartic. HAMBURGH DISPENSATORY.)

## Form. 933. SOLUTIO HYDRO-SULPHATIS CALCI.

*A Hydrosulphate of the Protozoid of Calcare.*  
R Sulphur. pulveriz. lb j.; Calcis Vivi ℥ ij.; Aqu. tanæ lb. xv. Coque per partem horæ, quartâ cola. (PIERQUIN'S Antiparitic Milk. HAMBURGH PASSING recommend it as a gargle in salivation; a dessert or table spoonful of it is to be taken daily in some soup (mutton or veal broth), in case poisoning by mercurials.)

## Form. 934. SOLUTIO REFRIGERANS.

R Nitrat. Potassæ ʒss.; Ammonia Hydrochlor. Aq. For. ʒ viij. Solve leni cum calore, et Camphoræ pulverizat. ʒjss.; Alcoholis q. s. M. Capiat ʒj.—ʒ ij. in Decocti Horvel cyatho.

## Form. 935. SYRUPUS ANTIMONIATÆ.

R Kermis Miner. ʒj.; Syrupi Scillæ, Syrupi Albi ʒā ʒjss. M. Capiat coch. j.—ij. minima, ter terve in die.

## Form. 936. TINCTURA ASTRINGENS.

R Catechu, Myrrhæ, ʒā ʒss.; Pulv. Cinchonæ Balsami Peruvian. ʒjss.; Spirit. Armoniacis O Spirit. Vini Rectificati, ʒā ʒjss. Misce, et d (For Sponginess of the Gums.)

## Form. 937. TROCHISCI ASTRINGENS.

R Catechu ʒ ij.; Moschi ʒ ij.; Sacchar. Albi ʒj. Mucilag. G. Tragacanthæ q. s. Misce. Fiant chisel parvuli. (For Relaxation of the Uvula, Hæmorrh., &c.)

## Form. 938. UNGUENTI CHLORURETI CALCIS.

R Chlorureti Calcis in pulv. subtil. rosæ, ʒjss.; bith. Mineral. in pulv. ʒ ij. Misce benè; cum Axung. ʒjss.; Olei Amygdal. Dulc. ʒj. Fiat Unguentum.

## Form. 939. VINUM FERRI.

R Tincturæ Ferri Sesquichloridi ʒj.; Vini Albi ℥ ʒ xv. M

# INDEX.

The Numerals denote the FIRST and SECOND VOLUMES; the figures the number of the page. The THIRD or LAST VOLUME is indicated by figures, the numbers of the pages only. The FORMULÆ in the APPENDIX are represented by F. followed by the number in figures, and by Ap. and the number of the page also in figures.

A.		AG	
Abdomen, auscultation of - - -	i. 5	Aconite, recommended in acute rheumatism - - -	630-2
— examination of - - -	i. 1	Acrids, vegetable, operation of, in poisoning by - - -	355
— inspection of - - -	i. 1	— treatment of poisoning by - - -	352
— manual examination of - - -	i. 2	Acro-alterant medicines, enumerated, &c. - - -	1053
— percussion of - - -	i. 4	— poisons, described - - -	405
— various states and appearances of, requiring examination - - -	i. 2-4	— operation of - - -	406
Abdominal tumours, feigned - - -	i. 885	Acro-narcotic poisons, described - - -	431
Abortion, <i>Bibliog. and Refer.</i> - - -	i. 11	Acro-sedatives, arrangement and enumeration of - - -	1053
— causes of - - -	i. 5	Action, vascular, to be allayed when increased - - -	1046
— causes depending on the uterus and placenta - - -	i. 6	Actions, morbid, duration of - - -	i. 596
— causes depending on the fetus - - -	i. 6	— vital and vascular, should be equalised - - -	1045
— definition of - - -	i. 5	Acute, acceptance of the term - - -	i. 596
— diagnosis of - - -	i. 8	Adhesions, <i>Bibliography</i> - - -	i. 36
— feigned - - -	i. 885	— of cellular tissue - - -	i. 34
— occasional exciting causes - - -	i. 6	Adhesions, morbid, described - - -	i. 33
— palliative treatment of - - -	i. 11	— of mucous surfaces - - -	i. 33
— pathological causes of - - -	i. 7, 8	— of opposite surfaces of the pericardium - - -	ii. 186
— prognosis of - - -	i. 9	— pathology of - - -	i. 32
— prophylactic treatment of - - -	i. 9	— of the pleura, described - - -	i. 288
— remedial treatment of - - -	i. 11	— reparative - - -	i. 33
— symptoms of - - -	i. 7	— of serous surfaces - - -	i. 34
— treatment of - - -	i. 9	— various, &c. - - -	i. 35
Abscess, <i>Bibliog. and Refer.</i> - - -	i. 23	Adipose tissue, effusion of blood into - - -	i. 37
— chronic - - -	i. 14	— hypertrophy of - - -	i. 36
— chronic, pus in - - -	i. 15	— its morbid states - - -	i. 36
— consecutive - - -	i. 16	— of tumours in - - -	i. 37
— definition of - - -	i. 12	Adolescence, remarks respecting - - -	i. 42
— diffusive, or in cachectic habits - - -	i. 13	Adult age, notices of - - -	i. 43
— from acute sthenic inflammation - - -	i. 12	Adventitious productions, consequent on inflammation - - -	i. 391
— of the opening of - - -	i. 22	— from perverted organic action in their seats - - -	i. 391
— of the prognosis of - - -	i. 20	Adventitious secretions and productions - - -	i. 588
Abscess in the brain - - -	i. 210	Adynamic Fever. See also Typhoid Fever - - -	i. 999
— of brain, the parietes of - - -	i. 210	Adynamia. See also Debility - - -	i. 473
— lumbar. See also Psoitis - - -	467	Ægophony, described - - -	i. 159
— of the absorption, &c., of the contents of - - -	i. 21	Æther Phosphoratus - F. 6 & 7. Ap. 1	i. 588
— of the diagnosis of - - -	i. 19	Ætiology, or causation of disease - - -	i. 588
— of the influence of air when admitted into - - -	i. 18	Affections of mind, as remedial agents - - -	1050
Abscess of the kidney - - -	ii. 631	— classification of - - -	ii. 443
— chronic, of the kidney - - -	ii. 632	Affections of the sexual organs caused by pregnancy - - -	449
Abscess of the liver, description of - - -	ii. 736-8	— treatment of - - -	449
— different kinds of - - -	ii. 731, 2	Affections, various sympathetic, during pregnancy - - -	452-6
— directions in which it may point or open - - -	ii. 738	Affusion of cold or tepid water for insanity - - -	ii. 526
— external opening of - - -	ii. 749	Affusion of cold water on the head, &c., first advised by the Author for poisoning by prussic acid - - -	366
— regimen and diet in - - -	ii. 749	After-pains, defined - - -	i. 37
— symptoms of - - -	ii. 736-8	— symptoms and diagnosis of - - -	i. 37
— treatment of its several modes of opening - - -	ii. 740-9	— treatment of - - -	i. 38
— treatment of - - -	ii. 747-9	Agalactia. See also Milk, deficiency or suppression of - - -	ii. 804
Abscess of the spleen described - - -	895	Agarazoids noticed - - -	1378
— of the treatment of - - -	i. 21	Age, advanced, described - - -	i. 48
— origin of consecutive - - -	i. 16	—, divisions of - - -	i. 44
— parietes of - - -	i. 13	— adult and mature, remarks on - - -	i. 44
— parietes of chronic - - -	i. 15		
— pathology of - - -	i. 12		
— primary and secondary, of the pancreas - - -	6		
— pus contained in - - -	i. 13		
— symptomatic, described - - -	i. 15		
— termination of - - -	i. 17		
— progress of - - -	i. 17		
Abscess of the vulva - - -	1300		
Absorbent Glands. See also Lymphatic Glands - - -	ii. 799		
Absorbent system, diseases of - - -	ii. 713		
Absorption, following metamorphosis and waste of tissues - - -	i. 25		
— from diseased organs and structures - - -	i. 25		
— from the alimentary canal, pathology of - - -	i. 24		
— from the lungs, pathology of - - -	i. 23		
— in relation to the causation, perpetuation, and removal of disease - - -	i. 23		
— of morbid matters in the economy - - -	i. 25		
— on the skin, pathology of - - -	i. 23		
Abstinence, associated with morbid agents - - -	i. 27		
— bibliography of - - -	i. 27		
— feigned - - -	i. 885		
— its morbid effects - - -	i. 26		
— treatment of its morbid effects - - -	i. 27		
Accession of disease to be studied - - -	1037		
Accessory symptoms in insanity - - -	ii. 440		
Acephalocysts, described. See also Hydatids - - -	ii. 252		
— characters of - - -	ii. 1394		
— of the liver - - -	ii. 756		
Acetic acid, slow poisoning by - - -	355		
Acetum Antihystericum - F. 1. Ap. 1	i. 1		
Acetum Camphoratum - F. 2. Ap. 1	i. 1		
— Camphoræ et Ammoniac - F. 3. Ap. 1	i. 1		
Acid, acetic, of poisoning by - - -	337		
— hydrocyanic, its use in phthisis - - -	1162		
— See Prussic Acid, poisoning by - - -	361-6		
— oxalic, poisoning by - - -	342		
— treatment of poisoning by - - -	342		
— prussic. See Prussic Acid, poisoning by - - -	361-6		
— sulphuric, its use in phthisis - - -	1161		
Acids contained in urine, described - - -	1203, 4		
Acids, mineral, appearances after poisoning by - - -	340, 1		
— slow poisoning by - - -	355		
— symptoms of poisoning by - - -	338, 9		
— treatment of poisoning by - - -	341, 2		
Acids, of their use in phthisis, 1161, 2	i. 2		
Acidum Nitro-Hydrochloricum - F. 4. Ap. 1	i. 1		
— Nitro-Hydrochl. dilut. F. 5. Ap. 1	i. 1		
Aene, causes of - - -	i. 29		
— definition of - - -	i. 27		
— diagnosis of - - -	i. 29		
Aene indurata, described - - -	i. 28		
— treatment of - - -	i. 30		
— prognosis of - - -	i. 29		
Aene punctata, described - - -	i. 29		
— treatment of - - -	i. 31		
Aene rosacea, described - - -	i. 28		
— treatment of - - -	i. 31		
Aene simplex, described - - -	i. 28		
— treatment of - - -	i. 30		
Aene syphilitica, described - - -	i. 29		
— treatment of - - -	i. 32		
Aconite, its use in phthisis - - -	1162		
— operations and symptoms from poisoning by - - -	376, 7		
— poisoning by - - -	376		
— treatment of - - -	377		

Age, as disposing to phthisis - 1127  
 — as predisposing to insanity - ii. 484  
 — as predisposing to disease - 1, 560  
 — *Bibliography, &c.* of - 1, 49  
 — changes of structure produced by - 1, 44  
 — declining, described - 1, 48  
 — in its generic acceptation - 1, 38  
 — in its specific acceptation - 1, 44  
 — its first period - 1, 38  
 — its several periods arranged - 1, 38  
 — functional changes resulting from - 1, 46  
 — old, described - 1, 48  
 Agents, examination of, producing irritation - ii. 616-18  
 — hygienic, arrangement of - 1050  
 — medicinal, the operations of - 1050, 1  
 — physical and medicinal, causing insanity - ii. 491-3  
 — their effects on the character of irritation - ii. 616  
 — therapeutical classification of - 1050-4  
 Ageusia, described - 11  
 Ague, appearances in fatal cases of - 1, 938  
 — *Bibliog. and Refer. &c.* - 1, 945  
 Ague-cakes, described - 1, 938  
 Ague, causes of - 1, 939  
 — adynamic states of - 1, 936  
 — complicated states of - 1, 936  
 — complicated, with disease of abdominal organs - 1, 936  
 — with disease of respiratory organs - 1, 937  
 — consequences and terminations of - 1, 937  
 — conversion of one type into another - 1, 936  
 — definition of - 1, 934  
 — diagnosis of - 1, 939  
 — diet and regimen of - 1, 945  
 — inferences as to its nature and consequences - 1, 940  
 — intermissions and paroxysms of - 1, 935  
 — malignant states of - 1, 936  
 — masked and anomalous - 1, 937  
 — means of cure during the intermissions - 1, 943, 4  
 — nature, or proximate cause of - 1, 939  
 — paroxysms and intermissions of - 1, 935  
 — prognosis of - 1, 938  
 — regimen of convalescence from - 1, 945  
 — remedies which prevent the paroxysms of - 1, 943, 4  
 — simple or mild - 1, 935  
 — cerebral complication of - 1, 937  
 — inflammatory state of - 1, 936  
 — treatment during the intermissions - 1, 941, 2  
 — treatment of adynamic - 1, 941  
 — of complicated - 1, 941  
 — of, during the paroxysm - 1, 940  
 — of inflammatory - 1, 941  
 — of masked or anomalous - 1, 945  
 — of simple - 1, 940  
 — of the sequelæ - 1, 945  
 — types or varieties of - 1, 934  
 Air, of the influence of, when admitted into abscesses - 1, 18  
 — contaminated and close states of, a cause of scrofula 739, 40  
 — heated, as a disinfectant - 246  
 — respired, states of, as signs of disease - 1001  
 Air-cells, dilatation of the - ii. 781  
 Air-passages, diseases of the - 1, 244  
 Albumen in the urine, tests for  
 Albuminous principles in morbid growths - 710  
 Albuminuria, description of. See also Nephritis Cachectica - ii. 642  
 Alcohol, poisoning by, symptoms of - 36  
 — treatment of poisoning by - 36  
 Algiers, climate of, advised for phthisis - 1171

Alimentary canal, absorption from, &c. - 1, 24  
 — morbid changes of - 1, 536  
 Alopecia, described. See also Baldness - ii. 137, 138  
 Alopecia, Syphilitic, described - 1331  
 Alkalies, &c., advised for rheumatism - 632  
 — poisoning by, symptoms of - 344  
 — appearances after death from - 345  
 — slow poisoning by - 356  
 — of their use in phthisis - 1162  
 Alkaline sulphurets, poisoning by - 394  
 — treatment of - 393  
 Almonds, bitter, poisoning by - 365  
 Alterants, vegetable, mineral, and animal - 1053  
 Alterations of blood in disease - 1, 180  
 — of structure connected with insanity - ii. 474-481  
 — of structure in puerperal fevers, inquiries respecting - 927-29  
 — of structure observed after nephritis - ii. 633  
 Alternation of generation in worms - 1378  
 Alvine Concretions. See also Concretions, Intestinal - 1, 397  
 Amaurosis, *Bibliog. and Refer.* - 1, 62  
 — causes of - 1, 50  
 — congestive - 1, 54  
 — definition of - 1, 50  
 — diagnosis of - 1, 57  
 — from disorganisation - 1, 55  
 — efficient causes of - 1, 51  
 — functional - 1, 54  
 — inflammatory - 1, 56  
 — from injury - 1, 55  
 — from lesions of the nerves, &c. - 1, 56  
 — from organic changes - 1, 55  
 — pathology of - 1, 52  
 — prognosis of - 1, 57  
 — seats of - 1, 50  
 — stages, grades, and forms of - 1, 54  
 — symptoms of - 1, 52  
 — treatment of congestive - 1, 60  
 — of functional - 1, 58  
 — of inflammatory - 1, 61  
 — of organic, &c. - 1, 61  
 Amenorrhœa, causes of - ii. 837  
 — complicated with hysteria and epilepsy - ii. 842  
 — complicated with various diseases - ii. 842  
 — with vicarious hæmorrhage - ii. 842  
 — from congenital and organic lesion - ii. 838  
 — treatment of - ii. 839  
 — diagnosis of - ii. 836  
 — functional - ii. 836  
 — pathological states causing - ii. 837  
 — prognosis of - ii. 837  
 — prognosis of complicated - ii. 843  
 — regimen and diet for - ii. 838  
 — treatment of - ii. 837  
 — of complicated - ii. 843  
 — various means advised for - ii. 837, 8  
 Amentia, described - ii. 460  
 America, the question of the introduction of syphilis from, considered - 1323-5  
 Ammoniacum, formulæ for prescribing in phthisis - 1162  
 Amusements and employments for the insane - ii. 538  
 Anæsthetics, enumeration of - 1053  
 Anasarca, *Bibliog. and Refer.* - 1, 640  
 — consecutive acute - 1, 636  
 — consequent upon scarlet fever - 678  
 — definition of - 1, 635  
 — description of - 1, 635  
 — from disease of the kidneys - 1, 636  
 — primary acute and sub-acute - 1, 636  
 — primary asthenic - 1, 637  
 — symptomatic - 1, 638  
 — treatment of acute general - 1, 639  
 — of primary asthenic - 1, 639  
 — of primary sthenic - 1, 639  
 — of symptomatic - 1, 640  
 Anatomy, general, of scirrhus and other tumors - 712  
 — pathological, of phthisis - 1113-9  
 Ancients, their opinions of mind and vital phenomena - ii. 498  
 — of life and organisation - ii. 498

Ancylostomum, systematic description of the genus - 1461  
 Ancylostomum duodenale, systematic description of - 1461  
 — examination of cases after death - 1462  
 — pathology of - 1462  
 — symptoms of this worm - 1462  
 — systematic description of - 1461  
 — treatment of - 1416  
 Andes, elevated localities on the, advised for phthisis - 1171, 2  
 Anemone, species of, poisoning by - 359  
 Aneurism, different forms - 1, 117  
 Aneurism of aorta, described - 1, 72  
 — causes of - 1, 75  
 — effects produced by - 1, 74  
 — of its opening or bursting - 1, 74  
 — symptoms of - 1, 74  
 — treatment of - 1, 77  
 — varieties of - 1, 77  
 Angina, complicated, treatment of - 1066  
 Angina, diffusive, associations or complications of - 1063  
 — causes of - 1061  
 — definition of - 1061  
 Angina, erysipelatous, described - 1061, 3  
 — symptoms of - 1062  
 — terminations and prognosis of - 1062, 3  
 — treatment of - 1063  
 Angina Membranacea. See also Croup - 1, 46  
 Angina Pectoris, acute, described - 1, 62  
 — *Bibliog. and Refer.* - 1, 62  
 — causes of - 1, 62  
 — proximate cause of - 1, 64  
 — chronic, described - 1, 62  
 — definition of - 1, 62  
 — diagnosis of - 1, 64  
 — pathology of - 1, 64  
 — prognosis of - 1, 64  
 — symptoms of - 1, 62  
 — treatment of - 1, 65  
 — of, during the intervals - 1, 67  
 — of in the paroxysm - 1, 65  
 Angina with pellicular exudation - 1068  
 Angina pellicularis, appearances of, after death - 1067  
 — description and terminations of - 1068  
 — treatment of - 1065  
 Angina plastica, constitutional symptoms of - 1062  
 — definition of - 1069  
 — description of - 1060, 60  
 Angina Pharyngea. See also Pharyngitis - 1067  
 Angina Tonsillaris. See also Tonsillitis - 1066, 7  
 Angina Trachealis. See also Croup - 1, 46  
 Angor Pectoris. See also Angina Pectoris - 1, 62  
 Animal functions, sympathetic relations of - 962  
 Animal molecules, injurious effects of - 1, 137  
 Anæmia, *Bibliog. and Refer.* - 1, 173  
 — causes of - 1, 173  
 — complicated - 1, 174  
 — general, described - 1, 173  
 — local, described - 1, 173  
 — pathology of - 1, 173  
 — symptoms of - 1, 174  
 — treatment of - 1, 175  
 Anæsthesia from chloroform and vapours of æthers - 491, 3  
 Anæsthesia, described - 11, 77  
 — pathology of - 11, 77  
 Anosmia, described - 11  
 Anthelmintics, arrangement and enumeration of - 1054  
 — those advised against *Tænia* 1414  
 Anthrax, described. See also Carbuncle - 1, 1067

 — treatment of indolent - 1348  
 Bullma described - 1. 108  
 Bullæ, definition of - 1. 271  
 Burial places productive of pestilence and disease - 98  
 Burying places, restrictions respecting, advised - 235

## C.

Cachexia Africana, noticed 1. 885  
 — of parents productive of scrofula - 735  
 — syphilitic, described - 1334, 5  
 — verminous described - 1406  
 Cachexy, *defined* - 1. 272  
 — symptoms of - 1. 272  
 — treatment of - 1. 273  
 — African causes of - 1. 273  
 — defined - 1. 273  
 — described - 1. 273  
 — treatment of - 1. 274  
 — mercurial, described - 412  
 Cacodemonia described - ii. 455  
 Cæcum, acute inflammation of 1. 277  
 — symptoms of acute inflammation of - 1. 278  
 — treatment of acute inflammation of - 1. 281  
 — chronic inflammation of the 1. 279  
 — symptoms of chronic inflammation of - 1. 280  
 — terminations and complications of chronic inflammation of - 1. 280  
 — its diseases - 1. 274  
 — symptoms of its disorders 1. 276  
 — treatment of its disordered functions - 1. 277  
 — prognosis of its diseases 1. 281  
 — disordered functions of 1. 275  
 — pathology of its disorders 1. 275  
 — inflammations of, in connection with *colitis* - ii. 375  
 — causes of its inflammations 1. 277  
 — treatment of other inflammatory diseases of - 1. 282  
 — inflammation of its appendix - 1. 378  
 — treatment of inflammation of its appendix - 1. 281  
 — inflammation of its surrounding tissues - 1. 279  
 — laceration of the - 1. 280  
 Calculi, biliary, described - 1. 39  
 — intestinal, origin of - 1. 39  
 — in prostate gland - 352  
 — diagnosis of - 453  
 — treatment of - 453  
 — renal, diagnosis of - 1320  
 — symptoms of - 1324  
 — symptoms of their passage to the bladder - 1321  
 — treatment of - 1322  
 — treatment of the passage of, to the bladder - 1323, 3  
 — vesical, treatment of - 1323  
 — urinary, age and sex as disposing to - 1326  
 — urinary, *Bibliog. & Refer.* 1326  
 — diagnosis of, in the bladder 1331  
 — symptoms of, in the bladder 1331  
 — causes of - 1225, 8  
 — of climate, locality, and race, as predisposing to - 1226, 7  
 — mode of ascertaining their composition - 1229, 3  
 — chemical composition of - 1222  
 — of concretions in urine, described - 1221-25  
 — urinary, from constitutional and vital conditions - 1228  
 — urinary, diagnosis of - 1330  
 — of diet and regimen as causes of - 1227  
 — from disease of urinary passages - 1228

Calculi from foreign bodies - 1228  
 — forms of - 1222  
 — of their growth and origin - 1228, 9  
 — habits of living which predispose to - 1226  
 — inferences as to their formation - 1228  
 — treatment of, in kidneys - 1232  
 — from mal-assimilation, &c. 1227, 8

 Pyelitis, complicated with dis-  
 eased bladder, prostate, &c. 11. 662  
 — from calculi or gravel - 11. 659  
 — complications of - 11. 662  
 — diagnosis of - 11. 660, 1  
 — prognosis of - 11. 662  
 — several states of - 11. 660  
 — treatment of, when caused  
 by renal calculi - 11. 665  
 — with tumour from collec-  
 tion of matter in the pelvis  
 of the kidney, treatment of 11. 666  
 Pyelitis, acute, description of 11. 648  
 — treatment of - 11. 664  
 — chronic, description of 11. 659  
 — treatment of - 11. 665  
 Pyelo-nephritis, or inflammation  
 of the pelvis, calices, and sub-  
 stance of the kidneys - 11. 663  
 — description of - 11. 663  
 Pyrosis, Bibliog. and Refer. - 565  
 — causes of - 563  
 — complications of - 562  
 — diagnosis of - 562  
 — indications and means of  
 cure - 564  
 — nature of - 563  
 — symptoms of - 562  
 — synonyms and definition  
 of - 561, 2  
 — treatment of - 563  
 Q.  
 Quarantine, importance of 11. 350  
 — for preventing pesti-  
 lence - 237-9  
 — success of, in the United  
 States - 237-9  
 R.  
 Rabies, appearances after death  
 from - 570  
 — Bibliog. and Refer. - 566-8  
 — causes of - 568  
 — the specific cause of ex-  
 amined - 573  
 — can it be communicated  
 otherwise than by the bite of  
 a rabid animal? - 575  
 — can it be communicated  
 otherwise than by inocula-  
 tion? - 575  
 — curative means (?) advised  
 for - 583-5  
 — description of - 566, 8  
 — diagnosis of - 571  
 — literary history of - 565  
 — medulla oblongata and spinal  
 chord in - 571  
 — nature of, inquired into - 576

Rabies, pathological inferences and remarks respecting - 576-8  
 — several means advised for preventing - 579-582  
 — prognosis as respects the bite of a rabid animal - 573  
 — when the disease has declared itself - 572  
 — by what secretions of the infected animal is the disease communicated? - 577  
 — symptoms of, in the canine race - 569, 579  
 — in the lower animals - 569  
 — its stages - 567, 8  
 — *synonyms and definition* of - 565  
 — treatment of, advised by the author - 586  
 — curative (?) - 583-5  
 — prophylactic - 579-582  
 — the animals capable of generating, de novo, the virus of - 575  
 — in what manner does the virus causing, act? - 577  
 — of the origin of the virus causing - 574  
 Race, human, considered in respect of phthisis - 1129, 30  
 — influence of, on small-pox - 821  
 Races, the influence of climate on - 1, 342-  
 — prevailing diseases in - 1, 342  
 — dark, the relations of climate to - 1, 344  
 — phthisis in the - 1, 107  
 — pleurisy in the - 282  
 — white, the relations of climate to - 1, 342  
 Rachialgia, causes of - 864  
 — *definition* of - 862  
 — diagnosis of - 864  
 — nature of - 865  
 — prognosis of - 864  
 — treatment of - 865-7  
 — hysterical, noticed - 862  
 — treatment of - 865-7  
 — rheumatic, gouty, and other forms of - 863  
 — treatment of - 865-7  
 Rachialgitis, *definition* of - 872  
 Radesyge, notice of - ii, 704  
 Ramollissement of brain - 1, 214

 — — predisposing causes of - 774-6  
 — — complications of - - 772  
 — — description of - - - 770  
 — — diagnosis of - - - 773  
 — — complicated with diarrhoea and dysentery - - - 773  
 — — historical sketch of - - 768  
 — — nature of - - - 778  
 — — of old age, described - - 553  
 — — means for the prevention of - - - 778-81  
 — — prognosis of - - - 773  
 — — *synon.* and *definit.* of - - 768  
 — — treatment of - - - 782, 3  
 Sea-coast, considered in relation to phthisis - - - 1171, 2  
 Sea-sickness, description of - 1370  
 — — nature of - - - 1370  
 — — pathology of - - - 1370  
 — — prognosis of - - - 1370  
 — — the remedial influence of - 1371  
 — — treatment of - - - 1373  
 Sea-shore, its climate in diseases - - - 1, 353  
 Sea-voyaging advised for phthisis - - - 1171  
 Seasons and weather disposing to phthisis - - - 1128  
 Secale cornutum, effects of - 433  
 Seclusion of the insane, how should it be carried out? - ii. 512  
 — — necessity of - - - 511  
 Seclusion or quarantine, advantages of, during pestilences - 244  
 Secondary syphilitic eruptions described - - - 1331  
 — — disease, diagnosis of - 1331  
 Secretion and excretion, when excessive, causes of phthisis - 1134  
 — — when excessive must be restrained - - - 1045  
 Secretions and productions, adventitious to the economy i. 588  
 — — adventitious to the situation - - - i. 584  
 — — alterations of depending upon organic nervous influence - - - i. 580  
 — — excrementitious, are under the influence of the organic nervous system - - - i. 582  
 — — of promoting the, in fever i. 927  
 — — misplaced - - - i. 584  
 — — morbid, susceptible of organisation - - - i. 590  
 — — recrementitious, under the influence of the organic nervous system - - - i. 581  
 — — and exhalations, transformations of - - - i. 583  
 Sedatives, mental and physical, enumerated - - - 1051  
 — — in cases of insanity - - ii. 531  
 Sedentary habits and occupations cause disease - - - i. 123  
 Sensation, paralysis of - - - 113  
 — — and sensibility, signs of disease furnished by - - - 981  
 — — — various perversions of - - - 981, 2  
 Sense, organs of, causes of disease acting on - - - i. 568  
 Senses, symptoms furnished by 976, 7  
 Sensibility, conscious or active - 40  
 — — forms and modes of - - 40  
 — — — unconscious or passive - 40  
 — — — organic, active, and passive - - - 40  
 — — — lesions of, in insanity ii. 434-437  
 — — morbid, of the uterus - 1240  
 — — and sensation, their sympathies, &c. - - - 961, 2  
 Sensitive and motor powers, influenced by different columns of the medulla spinalis - 37  
 Sentiments and feelings, as causing disease - - - i. 568  
 Septic Pestilence. See Pestilence, Septic - - - 189  
 Sepulture, viewed as productive of pestilence and disease - 98  
 Sequela of measles described - ii. 817  
 — — of scarlet fever described 679-9  
 — — treatment of - - - 697, 8  
 Sero-enteritis. See Enteritis, description of - - - ii. 474  
 Serous and synovial membranes 785  
 — — surfaces, adhesions of - i. 34  
 Serpents, poisoning by, symptoms of - - - 435, 6  
 — — — antidotes and treatment of - - - 430, 7  
 Serum infiltrated into the textures of the heart - - - ii. 216  
 — — in the urine - - - 1218  
 Sex, as predisposing to disease i. 560  
 — — influence of, on the pulse - 648  
 Sexes, comparative liability of the, to tuberculosis - - 767  
 Sexual organs, signs and symptoms furnished by the - - 1007  
 — — of female, signs furnished by - - - 1008  
 — — — sympathies evolved by - 963, 4  
 Shaking-palsy, description of - 24  
 — — treatment of - - - 24  
 Sheath of nerves, rheumatism of - - - 616  
 Shingles, description of - - ii. 231  
 Ships of war, protection of, from pestilence - - - 243  
 Shock, *Bibliog. and Refer.* - - 790  
 — — causes and phenomena of - 786  
 — — description of - - - 787  
 — — — diagnosis of - - - 788  
 — — — forms of - - - 786, 7  
 — — of the nervous system caused by parturition - - - 486  
 — — — treatment of - - - 487, 8  
 — — — prognosis of - - - 788  
 — — — treatment of - - - 789  
 — — — vital or nervous, *defined* - 785  
 Sialogogues, enumeration of - 1052  
 Sibbens, description of - - 1337  
 Sighing, as a symptom - - - 1005  
 Signs and symptoms furnished by the attitude and countenance - - - 960, 7  
 — — — of the appearance of the body - - - 966  
 Sight, defects of, feigned - - i. 891  
 Silver, nitrate of, poisoning by - 351  
 Singultus, description of. See Hiccup - - - ii. 534  
 Sinking after parturition - - 496  
 Sinuses of the brain, lesions of i. 208  
 — — of dura mater, inflammation of - - - 1308  
 — — of the vertebrae, effects of congestion of - - - 38  
 Sites of tumours and morbid formations, respecting the - - 723  
 Sivens, description of - - - 1337  
 Sketch, historical, of treatment advised by authors for phthisis - - - 1135-43  
 Skin, of absorption from - - - i. 23
- Skin, alterations of its appearance and structure - 761, 1  
 — — bronzing of, connected with lesions of the supra-renal bodies - - - 1423-4  
 — — changes of the colour of - 791, 1  
 — — changes in the textures of - 791, 1  
 — — affections of the cuticle and nails in diseases of - - 794  
 — — diseases of the, *Bibliog. and Refer.* - - - 801  
 — — — natural methodic arrangement of diseases affecting the - - - 798-801  
 — — — classification of the diseases of the - - - 798-801  
 — — — — by Dr. J. H. Bennett - 801  
 — — — — by M. Hayer - - - 801  
 — — — diseases of, in connection with gastro-enteric disorders - - - 5, 30  
 — — — functional alterations of - 50
